

ISO774x High-Speed, Robust-EMC Reinforced and Basic Quad-Channel Digital Isolators

1 Features

- 100 Mbps data rate
- Robust isolation barrier:
 - >100-year projected lifetime at 1500 V_{RMS} working voltage
 - Up to 5000 V_{RMS} isolation rating
 - Up to 12.8 kV surge capability
 - ±100 kV/μs typical CMTI
- Wide supply range: 2.25 V to 5.5 V
- 2.25-V to 5.5-V level translation
- Default output *high* (ISO774x) and *low* (ISO774xF) options
- Wide temperature range: –55°C to 125°C
- Low power consumption, typical 1.5 mA per channel at 1 Mbps
- Low propagation delay: 10.7 ns typical (5-V Supplies)
- Robust electromagnetic compatibility (EMC)
 - System-level ESD, EFT, and surge immunity
 - ±8 kV IEC 61000-4-2 contact discharge protection across isolation barrier
 - Low emissions
- Wide-SOIC (DW-16) and QSOP (DBQ-16) package options
- Automotive version available: [ISO774x-Q1](#)
- Safety-related certifications:
 - DIN VDE V 0884-11:2017-01
 - UL 1577 component recognition program
 - CSA, CQC, and TUV certifications

3 Description

The ISO774x devices are high-performance, quad-channel digital isolators with 5000 V_{RMS} (DW package) and 3000 V_{RMS} (DBQ package) isolation ratings per UL 1577. This family includes devices with reinforced insulation ratings according to VDE, CSA, TUV and CQC. The ISO7741B device is designed for applications that require basic insulation ratings only.

The ISO774x devices provide high electromagnetic immunity and low emissions at low power consumption, while isolating CMOS or LVCMOS digital I/Os. Each isolation channel has a logic input and output buffer separated by a double capacitive silicon dioxide (SiO₂) insulation barrier. These devices come with enable pins which can be used to put the respective outputs in high impedance for multi-master driving applications and to reduce power consumption. The ISO7740 device has all four channels in the same direction, the ISO7741 device has three forward and one reverse-direction channels, and the ISO7742 device has two forward and two reverse-direction channels. If the input power or signal is lost, default output is *high* for devices without suffix F and *low* for devices with suffix F. See the [Device Functional Modes](#) section for further details.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (May 2019) to Revision G	Page
• Added ISO7741B device to the data sheet for applications that require basic insulation only	1
• Combined CSA, CQC, and TUV Features bullets into a single bullet	1
• Deleted "All certifications complete" bullet in Features	1

Changes from Revision E (January 2018) to Revision F	Page
• Made editorial and cosmetic changes throughout the document	1
• Changed From: "Isolation Barrier Life: >40 Years" To: ">100-year projected lifetime at 1500 V _{RMS} working voltage" in Features	1
• Added "Up to 5000 V _{RMS} isolation rating" in Features	1
• Added "Up to 12.8 kV surge capability" in Features	1
• Added "±8 kV IEC 61000-4-2 contact discharge protection across isolation barrier" in Features	1
• Added "Automotive version available: <i>ISO774x-Q1</i> " in Features	1
• Changed From: "All Certifications Complete except CQC Approval of DBQ-16 Package Devices" To: "All certifications complete" in Features	1
• Updated Simplified Schematic to show two isolation capacitors in series per channel instead of a single isolation capacitor	1
• Added "Contact discharge per IEC 61000-4-2" specification of ±8000 V in ESD Ratings	8
• Added the following table note to <i>Data rate</i> specification: "100 Mbps is the maximum specified data rate, although higher data rates are possible."	8

• Changed V_{IORM} value for DW-16 package From: "1414 V_{PK} " To: "2121 V_{PK} " in Insulation Specifications table.....	10
• Changed V_{IOWM} values for DW-16 package From: "1000 V_{RMS} " and "1414 V_{DC} " To: "1500 V_{RMS} " and "2121 V_{DC} " in Insulation Specifications table	10
• Added 'see Figure 28 ' to TEST CONDITIONS of V_{IOWM} specification in Insulation Specifications	10
• Changed V_{IOSM} TEST CONDITIONS From: "Test method per IEC 60065" To: "Test method per IEC 62368-1" in Insulation Specifications table	10
• Updated certification information in Safety-Related Certifications table	11
• Switched the line colors for V_{CC} at 2.5 V and V_{CC} at 3.3 V in Figure 12	21
• Added Insulation Lifetime sub-section under Application Curve section.....	31
• Added 'How to use isolation to improve ESD, EFT, and Surge immunity in industrial systems' application report to Documentation Support section	34

Changes from Revision D (May 2017) to Revision E
Page

• Changed the DIN certification number and certification status throughout the document	1
• Changed the isolation rating of the DBQ package from 2500 V_{RMS} to 3000 V_{RMS}	1
• Added V_{TEST} to the conditions for the maximum transient isolation voltage parameter in the Insulation Specifications table	10
• Changed the value for the DBQ package from 3600 V_{PK} to 4242 V_{PK} throughout the document	10
• Changed the method b1 V_{ini} condition for apparent charge in the Insulation Specifications table	10
• Switched the labels for V_{CC1} falling and V_{CC2} rising in the graph legend of Power Supply Undervoltage Threshold vs Free-Air Temperature	21

Changes from Revision C (December 2016) to Revision D
Page

• Updated the Safety-Related Certifications table.....	11
• Changed the minimum CMTI from 40 to 85 in all Electrical Characteristics tables	12

Changes from Revision B (October 2016) to Revision C
Page

• Changed the Regulatory Information table to Safety-Related Certifications and updated content	11
• Changed the certifications from planned to certified in the Safety-Related Certifications table.....	11

Changes from Revision A (June 2016) to Revision B
Page

• Changed Feature From: High CMTI: ± 75 $kV/\mu s$ Typical To: High CMTI: ± 100 $kV/\mu s$ Typical	1
• Changed Feature From: All Certifications are Planned To: 'VDE, UL, and TUV Certifications for DW Package Complete; All Other Certifications are Planned'.....	1
• Changed the unit value of CLR and CPG From: μm To: mm in Insulation Specifications	10
• Changed From: "Plan to certify" To: "Certified" in column VDE of Safety-Related Certifications	11
• Added a conditions statement to Safety-Related Certifications	11
• Changed From: "Plan to certify" To: "Certified" in column UL of Safety-Related Certifications	11
• Changed From: "Plan to certify" To: "Certified" in column TUV of Safety-Related Certifications	11
• Changed From: "Certification Planned" To: 'Certificate number: 40040142' in column VDE of Safety-Related Certifications	11
• Changed From: "Certification Planned" To: "File number: E181974" in column VDE of Safety-Related Certifications	11
• Changed From: "Certification Planned" To: "Client ID number: 77311" in column TUV of Safety-Related Certifications ...	11
• Changed the CMTI TYP value From: 75 $kV/\mu s$ To: 100 $kV/\mu s$ in the Electrical Characteristics—5-V Supply	12
• Changed the CMTI TYP value From: 75 $kV/\mu s$ To: 100 $kV/\mu s$ in the Electrical Characteristics—3.3-V Supply	14
• Changed the CMTI TYP value From: 75 $kV/\mu s$ To: 100 $kV/\mu s$ in the Electrical Characteristics—2.5-V Supply	16

• Changed the t_{DO} TYP value From: 6 μ s To: 0.1 μ s and the MAX value From: 9 μ s To: 0.3 μ s in the Switching Characteristics—5-V Supply	18
• Changed the t_{DO} TYP value From: 6 μ s To: 0.1 μ s and the MAX value From: 9 μ s To: 0.3 μ s in the Switching Characteristics—3.3-V Supply	18
• Changed the t_{DO} TYP value From: 6 μ s To: 0.1 μ s and the MAX value From: 9 μ s To: 0.3 μ s in the Switching Characteristics—2.5-V Supply	19
• Added Note B to Figure 17	24
• Changed the Design Requirements paragraph	30
• Replaced the Power Supply Recommendations section	32

5 Description Continued

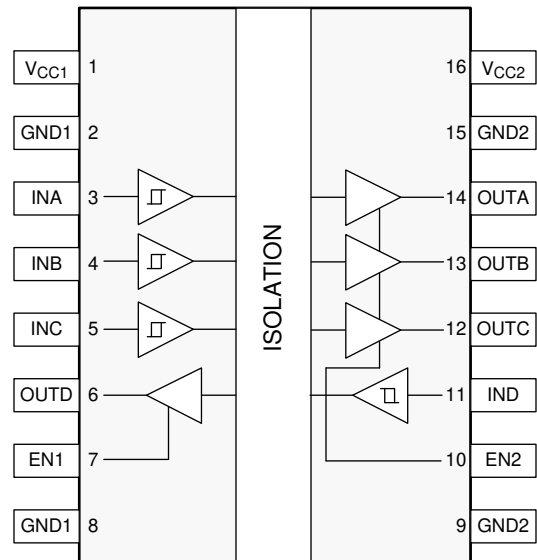

Used in conjunction with isolated power supplies, these devices help prevent noise currents on data buses, such as RS-485, RS-232, and CAN, or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. Through innovative chip design and layout techniques, electromagnetic compatibility of the ISO774x devices have been significantly enhanced to ease system-level ESD, EFT, surge, and emissions compliance. The ISO774x devices are available in 16-pin SOIC and QSOP packages.

7 Specifications

7.1 Absolute Maximum Ratings

 See ⁽¹⁾

		MIN	MAX	UNIT
V_{CC1}, V_{CC2}	Supply voltage ⁽²⁾	-0.5	6	V
V	Voltage at INx, OUTx, ENx	-0.5	$V_{CCX} + 0.5^{(3)}$	V
I_O	Output current	-15	15	mA
T_J	Junction temperature		150	°C
T_{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±6000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1500
		Contact discharge per IEC 61000-4-2; Isolation barrier withstand test ⁽³⁾⁽⁴⁾	±8000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) IEC ESD strike is applied across the barrier with all pins on each side tied together creating a two-terminal device.
- (4) Testing is carried out in air or oil to determine the intrinsic contact discharge capability of the device.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC1}, V_{CC2}	Supply voltage	2.25		5.5	V
$V_{CC(UVLO+)}$	UVLO threshold when supply voltage is rising		2	2.25	V
$V_{CC(UVLO-)}$	UVLO threshold when supply voltage is falling	1.7	1.8		V
$V_{HYS(UVLO)}$	Supply voltage UVLO hysteresis	100	200		mV
I_{OH}	High-level output current	$V_{CCO}^{(1)} = 5\text{ V}$		-4	mA
		$V_{CCO} = 3.3\text{ V}$		-2	
		$V_{CCO} = 2.5\text{ V}$		-1	
I_{OL}	Low-level output current	$V_{CCO} = 5\text{ V}$		4	mA
		$V_{CCO} = 3.3\text{ V}$		2	
		$V_{CCO} = 2.5\text{ V}$		1	
V_{IH}	High-level input voltage	$0.7 \times V_{CCI}^{(1)}$		V_{CCI}	V
V_{IL}	Low-level input voltage	0		$0.3 \times V_{CCI}$	V
DR	Data rate ⁽²⁾	0		100	Mbps
T_A	Ambient temperature	-55	25	125	°C

- (1) V_{CCI} = Input-side V_{CC} ; V_{CCO} = Output-side V_{CC} .
- (2) 100 Mbps is the maximum specified data rate, although higher data rates are possible.

- Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- This coupler is suitable for *safe electrical insulation (ISO774x)* and *basic electrical insulation (ISO7741B)* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- Apparent charge is electrical discharge caused by a partial discharge (pd).
- All pins on each side of the barrier tied together creating a two-terminal device.

7.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

T_S	Maximum safety temperature				150	$^\circ\text{C}$

- (1) The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) is that of a device installed on a High-K test board for leaded Surface Mount Packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance

9 Detailed Description

9.1 Overview

The ISO774x family of devices uses an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon dioxide based isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. If the ENx pin is low then the output goes to high impedance. The ISO774x devices also incorporate advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions due to the high frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, [Figure 19](#), shows a functional block diagram of a typical channel.

9.3.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO774x family of devices incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

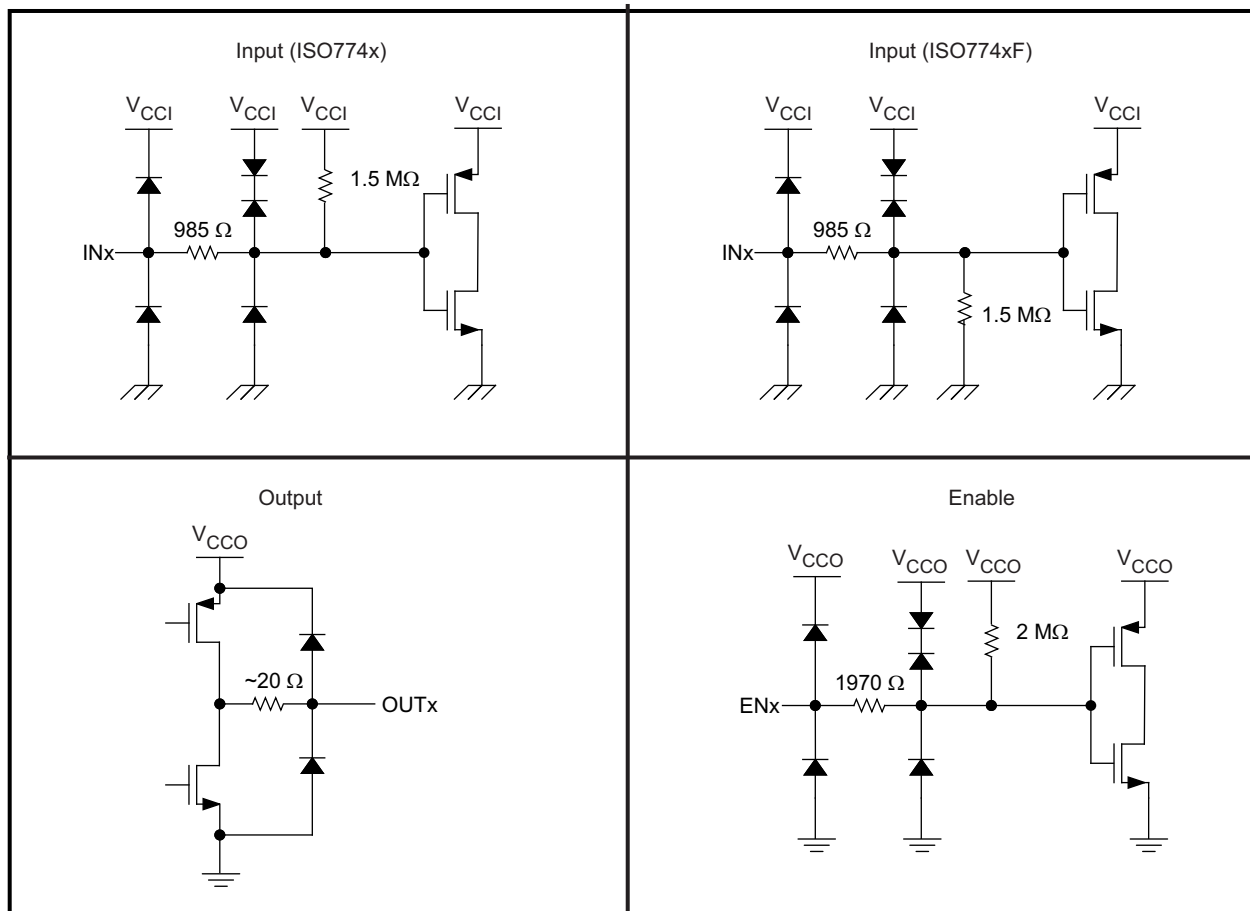

9.4 Device Functional Modes

Table 2 lists the functional modes for the ISO774x devices.

Table 2. Function Table⁽¹⁾

V_{CCI}	V_{CCO}	INPUT (INx) ⁽²⁾	OUTPUT ENABLE (ENx)	OUTPUT (OUTx)	COMMENTS
PU	PU	H	H or open	H	Normal Operation: A channel output assumes the logic state of its input.
		L	H or open	L	
		Open	H or open	Default	Default mode: When INx is open, the corresponding channel output goes to its default logic state. Default is <i>High</i> for ISO774x and <i>Low</i> for ISO774x with F suffix.
X	PU	X	L	Z	A low value of output enable causes the outputs to be high-impedance.
PD	PU	X	H or open	Default	Default mode: When V_{CCI} is unpowered, a channel output assumes the logic state based on the selected default option. Default is <i>High</i> for ISO774x and <i>Low</i> for ISO774x with F suffix. When V_{CCI} transitions from unpowered to powered-up, a channel output assumes the logic state of the input. When V_{CCI} transitions from powered-up to unpowered, channel output assumes the selected default state.
X	PD	X	X	Undetermined	When V_{CCO} is unpowered, a channel output is undetermined ⁽³⁾ . When V_{CCO} transitions from unpowered to powered-up, a channel output assumes the logic state of the input.

- (1) V_{CCI} = Input-side V_{CC} ; V_{CCO} = Output-side V_{CC} ; PU = Powered up ($V_{CC} \geq 2.25$ V); PD = Powered down ($V_{CC} \leq 1.7$ V); X = Irrelevant; H = High level; L = Low level; Z = High Impedance
 (2) A strongly driven input signal can weakly power the floating V_{CC} through an internal protection diode and cause undetermined output.
 (3) The outputs are in undetermined state when 1.7 V < V_{CCI} , V_{CCO} < 2.25 V.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The ISO774x devices are high-performance, quad-channel digital isolators. These devices come with enable pins on each side which can be used to put the respective outputs in high impedance for multi master driving applications and reduce power consumption. The ISO774x devices use single-ended CMOS-logic switching technology. The voltage range is from 2.25 V to 5.5 V for both supplies, V_{CC1} and V_{CC2} . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is, μ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

10.2 Typical Application

Figure 22 shows the isolated serial peripheral interface (SPI).

Figure 22. Isolated SPI for an Analog Input Module With 16 Input

Typical Application (continued)

10.2.1 Design Requirements

To design with these devices, use the parameters listed in [Table 3](#).

Table 3. Design Parameters

PARAMETER	VALUE
Supply voltage, V_{CC1} and V_{CC2}	2.25 to 5.5 V
Decoupling capacitor between V_{CC1} and GND1	0.1 μ F
Decoupling capacitor from V_{CC2} and GND2	0.1 μ F

10.2.2 Detailed Design Procedure

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO774x family of devices only require two external bypass capacitors to operate.

Figure 23. Typical ISO774x Circuit Hook-up

The DWW package provides wider creepage and clearance without the need for two isolators in series or an extra isolated power supply, saving design cost and board space. For more details, please refer to the technical document [How to Meet the Higher Isolation Creepage & Clearance Needs in Automotive Applications](#).

10.2.3 Application Curve

The following typical eye diagrams of the ISO774x family of devices indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

10.2.3.1 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See [Figure 27](#) for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 87.5% for lifetime which translates into minimum required insulation lifetime of 37.5 years at a working voltage that's 20% higher than the specified value.

[Figure 28](#) shows the intrinsic capability of the isolation barrier to withstand high voltage stress over its lifetime. Based on the TDDB data, the insulation withstand capability of DW-16 package is 1500 V_{RMS} with a lifetime of 135 years as illustrated in [Figure 28](#). Similarly, the insulation withstand capability of DWW-16 package is 2000 V_{RMS} with a corresponding lifetime of 34 years. DBQ-16 package at 400 V_{RMS} working voltage has a much longer lifetime than both DW-16 and DWW-16 packages. Factors, such as package size, pollution degree, and material group can limit the working voltage of a component.

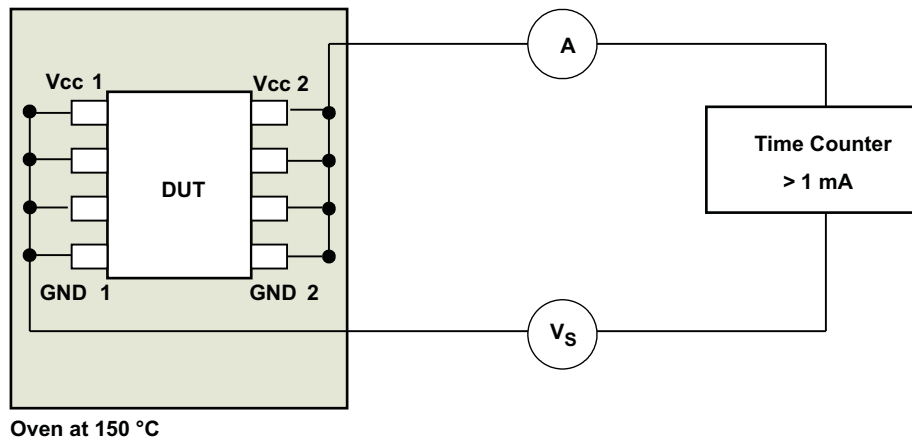

Figure 27. Test Setup for Insulation Lifetime Measurement

Figure 28. Insulation Lifetime Projection Data

11 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- μ F bypass capacitor is recommended at the input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#) or [SN6505A](#). For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies data sheet](#) or [SN6505A Low-Noise 1-A Transformer Drivers for Isolated Power Supplies data sheet](#).

12 Layout

12.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 29](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

12.1.1 PCB Material

For digital circuit boards operating below 150 Mbps, (or rise and fall times higher than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit boards. This PCB is preferred over cheaper alternatives due to its lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

13.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.
