

LP2966

LP2966 Dual 150mA Ultra Low-Dropout Regulator

Literature Number: SNVS028D

LP2966

Dual 150mA Ultra Low-Dropout Regulator

General Description

The LP2966 dual ultra low-dropout (LDO) regulator operates from a +2.70V to +7.0V input supply. Each output delivers 150mA over full temperature range. The IC operates with extremely low drop-out voltage and quiescent current, which makes it very suitable for battery powered and portable applications. Each LDO in the LP2966 has independent shutdown capability. The LP2966 provides low noise performance with low ground pin current in an extremely small MSOP-8 package (refer to package dimensions and connection diagram for more information on MSOP-8 package). A wide range of preset voltage options are available for each output. In addition to the voltage combinations listed in the ordering information table, many more are available upon request with minimum orders. In all, 256 voltage combinations are possible.

Key Specifications

Dropout Voltage: Varies linearly with load current. Typically 0.9 mV at 1mA load current and 135mV at 150mA load current.

Ground Pin Current: Typically 300 μ A at 1mA load current and 340 μ A at 100mA load current (with one shutdown pin pulled low).

Shutdown Mode: Less than 1 μ A quiescent current when both shutdown pins are pulled low.

Error Flag: Open drain output, goes low when the corresponding output drops 10% below nominal.

Precision Output Voltage: Multiple output voltage options available ranging from 1.8V to 5.0V with a guaranteed accuracy of $\pm 1\%$ at room temperature.

Features

- Ultra low drop-out voltage
- Low ground pin current
- <1 μ A quiescent current in shutdown mode
- Independent shutdown of each LDO regulator
- Output voltage accuracy $\pm 1\%$
- Guaranteed 150mA output current at each output
- Low output noise
- Error Flags indicate status of each output
- Available in MSOP-8 surface mount packages
- Low output capacitor requirements (1 μ F)
- Operates with Low ESR ceramic capacitors in most applications
- Over temperature/over current protection
- -40°C to +125°C junction temperature range

Applications

- Cellular and Wireless Applications
- Palmtop/Laptop Computer
- GPS systems
- Flat panel displays
- Post regulators
- USB applications
- Hand held equipment and multimeters
- Wireless data terminals
- Other battery powered applications

Typical Application Circuit

*SD1 and SD2 must be actively terminated through a pull up resistor. Tie to V_{IN} if not used.

**ERROR1 and ERROR2 are open drain outputs. These pins must be connected to ground if not used.

Minimum output capacitance is 1 μ F to insure stability over full load current range. More capacitance improves superior dynamic performance and provides additional stability margin.

		$\text{BW} = 300\text{Hz} - 300\text{kHz}$, $C_{OUT} = 10\mu\text{F}$	100			

Note 1: Absolute maximum ratings indicate limits beyond which damage to the device may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see Electrical characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: At elevated temperatures, devices must be derated based on package thermal resistance. The device in the surface-mount package must be derated at $\theta_{JA} = 235^\circ\text{C/W}$, junction-to-ambient. Please refer to the applications section on maximum current capability for further information. The device has internal thermal protection.

Note 3: The human body model is a 100pF capacitor discharged through a 1.5k Ω resistor into each pin.

Note 4: : Typical numbers are at 25 $^\circ\text{C}$ and represent the most likely parametric norm.

Note 5: : Limits are 100% production tested at 25 $^\circ\text{C}$. Limits over the operating temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's Averaging Outgoing Quality Level (AOQL).

Note 6: If used in a dual-supply system where the regulator load is returned to a negative supply, the LP2966 output must be diode-clamped to ground.

Note 7: The output PMOS structure contains a diode between the V_{IN} and V_{OUT} terminals that is normally reverse-biased. Reversing the polarity from V_{IN} and V_{OUT} will turn on this diode.

Note 8: Output voltage line regulation is defined as the change in output voltage from the nominal value due to change in input line voltage.

Note 9: Output voltage load regulation is defined as the change in output voltage from the nominal value when the load current changes from 1mA to 100mA.

Note 10: Output voltage cross regulation is defined as the percentage change in the output voltage from the nominal value at one output when the load current changes from 1mA to full load in the other output. This is an important parameter in multiple output regulators. The specification for $\Delta V_{O1}/\Delta I_{OUT2}$ is equal to the specification for $\Delta V_{O2}/\Delta I_{OUT1}$.

Note 11: Error Flag threshold and hysteresis are specified as the percentage below the regulated output voltage.

Note 12: Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below the nominal value. Drop-out voltage specification applies only to output voltages greater than 2.7V. For output voltages below 2.7V, the drop-out voltage is nothing but the input to output differential, since the minimum input voltage is 2.7V.

Electrical Characteristics (Continued)

Note 13: Output voltage tolerance specification also includes the line regulation and load regulation.

Note 14: LP2966 has fold back current limited short circuit protection. The knee is the current at which the output voltage drops 10% below the nominal value.

Note 15: V_{SDT} is the shutdown pin voltage threshold below which the output is disabled.

Note 16: The condition $V_{IN} = V_{O(NOM)} + 1V$ applies when $V_{out1} = V_{out2}$. If $V_{out1} \neq V_{out2}$, then this condition would apply to the output which is greater in value. As an example, if $V_{out1} = 3.3V$ and $V_{out2} = 5V$, then the condition $V_{IN} = V_{O(NOM)} + 1V$ would apply to V_{out2} only.

Note 17: Turn-on delay is the time interval between the low to high transition on the shutdown pin to the output voltage settling to within 5% of the nominal value. Turn-off delay is the time interval between the high to low transition on the shutdown pin to the output voltage dropping below 50% of the nominal value. The external load impedance influences the output voltage decay in shutdown mode.

Note 18: The limits for the ground pin current specification, $I_{GND(0,1)}$ will be same as the limits for the specification, $I_{GND(1,0)}$.

Typical Performance Characteristics Unless otherwise specified, $V_{IN} = V_{O(NOM)} + 1V$, $V_{OUT} = 3.3V$, $C_{OUT} = 1\mu F$, $I_{OUT} = 1mA$, $C_{IN} = 1\mu F$, $V_{SD1} = V_{SD2} = V_{IN}$, and $T_A = 25^\circ C$.

Applications Information

Input Capacitor Selection

LP2966 requires a minimum input capacitance of $1\mu\text{F}$ between the input and ground pins to prevent any impedance interactions with the supply. This capacitor should be located very close to the input pin. This capacitor can be of any type such as ceramic, tantalum, or aluminium. Any good quality capacitor which has good tolerance over temperature and frequency is recommended.

Output Capacitor Selection

The LP2966 requires a minimum of $1\mu\text{F}$ capacitance on each output for proper operation. To insure stability, this capacitor should maintain its ESR (equivalent series resistance) in the stable region of the ESR curves (*Figure 1* and *Figure 2*) over the full operating temperature range of the application. The output capacitor should have a good tolerance over temperature, voltage, and frequency. The output capacitor can be increased without limit. Larger capacitance provides better stability and noise performance. The output capacitor should be connected very close to the Vout pin of the IC.

FIGURE 1. ESR Curve for $V_{\text{OUT}} = 5\text{V}$ and $C_{\text{OUT}} = 2.2\mu\text{F}$

FIGURE 2. ESR Curve for $V_{\text{OUT}} = 3.3\text{V}$ and $C_{\text{OUT}} = 2.2\mu\text{F}$

LP2966 works best with Tantalum capacitors. However, the ESR and the capacitance value of these capacitors vary a lot with temperature, voltage, and frequency. So while using

Tantalum capacitors, it should be ensured that the ESR is within the limits for stability over the full operating temperature range.

For output voltages greater than 2.5V, good quality ceramic capacitors (such as the X7R series from Taiyoyuden) can also be used with LP2966 in applications not requiring light load operation ($< 5\text{mA}$ for the 5V output option). Once again, it should be ensured that the capacitance value and the ESR are within the limits for stability over the full operating temperature range.

The ESRD Series Polymer Aluminium Electrolytic capacitors from Cornell Dubilier are very stable over temperature and frequency. The excellent capacitance and ESR tolerance of these capacitors over voltage, temperature and frequency make these capacitors very suitable for use with LDO regulators.

Output Noise

Noise is specified in two ways-

Spot Noise or **Output noise density** is the RMS sum of all noise sources, measured at the regulator output, at a specific frequency (measured with a 1Hz bandwidth). This type of noise is usually plotted on a curve as a function of frequency.

Total output Noise or **Broad-band noise** is the RMS sum of spot noise over a specified bandwidth, usually several decades of frequencies.

Attention should be paid to the units of measurement. Spot noise is measured in units $\mu\text{V}/\sqrt{\text{Hz}}$ or $\text{nV}/\sqrt{\text{Hz}}$ and total output noise is measured in $\mu\text{V}(\text{rms})$.

The primary source of noise in low-dropout regulators is the internal reference. In CMOS regulators, noise has a low frequency component and a high frequency component, which strongly depend on the silicon area and quiescent current. Noise can be reduced in two ways: by increasing the transistor area or by increasing the current drawn by the internal reference. Increasing the area will increase the die size and decreases the chance of fitting the die into a small package. Increasing the current drawn by the internal reference increases the total supply current (ground pin current) of the IC. Using an optimized trade-off of ground pin current and die size, LP2966 achieves low noise performance with low quiescent current in an MSOP-8 package.

Short-Circuit Foldback protection

In the presence of a short or excessive load current condition, the LP2966 uses an internal short circuit foldback mechanism that regulates the maximum deliverable output current. A strong negative temperature coefficient is designed into the circuit to enable extremely higher peak output current capability (in excess of 400mA per output at room temperature, see typical curves). Thus, a system designer using the LP2966 can achieve higher peak output current capability in applications where the LP2966 internal junction temperature is kept below 125°C . Refer to the applications section on calculating the maximum output current capability of the LP2966 for your application.

Error Flag Operation

The LP2966 produces a logic low signal at the Error Flag pin (ERROR) when the corresponding output drops out of regulation due to low input voltage, current limiting, or thermal limiting. This flag has a built in Hysteresis. The timing diagram in *Figure 3* shows the relationship between the ERROR and the output voltage. In this example, the input voltage is changed to demonstrate the functionality of the Error Flag.

Applications Information (Continued)

FIGURE 3. Error Flag Operation

The internal error flag comparators have open drain output stages. Hence, the \overline{ERROR} pins should be pulled high through a pull up resistor. Although the \overline{ERROR} pin can sink current of 1mA, this current adds to the battery drain. Hence, the value of the pull up resistor should be in the range of 100k Ω to 1M Ω . **The \overline{ERROR} pins must be connected to ground if this function is not used.** It should also be noted that when the shutdown pins are pulled low, the \overline{ERROR} pins are forced to be invalid for reasons of saving power in shutdown mode.

Shutdown Operation

The two LDO regulators in the LP2966 have independent shutdown. A CMOS Logic level signal at the shutdown (\overline{SD}) pin will turn-off the corresponding regulator. Pins $\overline{SD1}$ and $\overline{SD2}$ must be actively terminated through a 100k Ω pull-up resistor for a proper operation. If these pins are driven from a source that actively pulls high and low (such as a CMOS rail to rail comparator), the pull-up resistor is not required. These pins must be tied to V_{in} if not used.

Drop-Out Voltage

The drop-out voltage of a regulator is defined as the minimum input-to-output differential required to stay within 100mV of the output voltage measured with a 1V differential. The LP2966 uses an internal MOSFET with an $R_{ds(on)}$ of 1 Ω . For CMOS LDOs, the drop-out voltage is the product of the load current and the $R_{ds(on)}$ of the internal MOSFET.

Reverse Current Path

The internal MOSFET in the LP2966 has an inherent parasitic diode. During normal operation, the input voltage is

higher than the output voltage and the parasitic diode is reverse biased. However, if the output is pulled above the input in an application, then current flows from the output to the input as the parasitic diode gets forward biased. The output can be pulled above the input as long as the current in the parasitic diode is limited to 150mA.

Maximum Output Current Capability

Each output in the LP2966 can deliver a current of more than 150mA over the full operating temperature range. However, the maximum output current capability should be derated by the junction temperature. Under all possible conditions, the junction temperature must be within the range specified under operating conditions. The LP2966 is available in MSOP-8 package. This package has a junction to ambient temperature coefficient (θ_{ja}) of 235 $^{\circ}\text{C}/\text{W}$ with minimum amount of copper area. The total power dissipation of the device is approximately given by:

$$P_D = (V_{in} - V_{OUT1})I_{OUT1} + (V_{in} - V_{OUT2})I_{OUT2}$$

The maximum power dissipation, P_{Dmax} , that the device can tolerate can be calculated by using the formula

$$P_{Dmax} = (T_{jmax} - T_A)/\theta_{ja}$$

where T_{jmax} is the maximum specified junction temperature (125 $^{\circ}\text{C}$), and T_A is the ambient temperature.

The following figures show the variation of thermal coefficient with different layout scenarios.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor manufactures products and uses packing materials that meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
