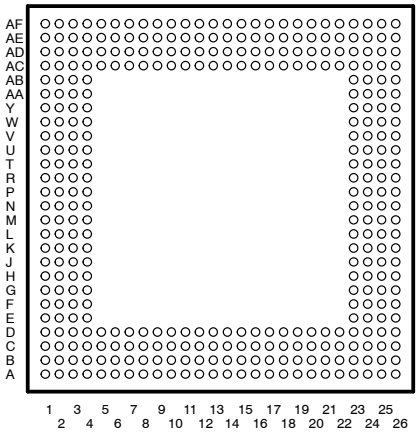
SPRS051H – JANUARY 1997 – REVISED MARCH 2004

- **High-Performance Fixed-Point Digital Signal Processor (DSP) TMS320C6201**
  - **5-ns Instruction Cycle Time**
  - **200-MHz Clock Rate**
  - **Eight 32-Bit Instructions/Cycle**
  - **1600 MIPS**
- **VelociTI™ Advanced Very Long Instruction Word (VLIW) TMS320C62x™ DSP CPU Core**
  - **Eight Independent Functional Units:**
    - **Six ALUs (32-/40-Bit)**
    - **Two 16-Bit Multipliers (32-Bit Results)**
  - **Load-Store Architecture With 32 32-Bit General-Purpose Registers**
  - **Instruction Packing Reduces Code Size**
  - **All Instructions Conditional**
- **Instruction Set Features**
  - **Byte-Addressable (8-, 16-, 32-Bit Data)**
  - **32-Bit Address Range**
  - **8-Bit Overflow Protection**
  - **Saturation**
  - **Bit-Field Extract, Set, Clear**
  - **Bit-Counting**
  - **Normalization**
- **1M-Bit On-Chip SRAM**
  - **512K-Bit Internal Program/Cache (16K 32-Bit Instructions)**
  - **512K-Bit Dual-Access Internal Data (64K Bytes) Organized as Two Blocks for Improved Concurrency**
- **32-Bit External Memory Interface (EMIF)**
  - **Glueless Interface to Asynchronous Memories: SRAM and EPROM**
  - **Glueless Interface to Synchronous Memories: SDRAM and SBSRAM**
- **Four-Channel Bootloading Direct-Memory-Access (DMA) Controller with an Auxiliary Channel**
- **16-Bit Host-Port Interface (HPI)**
  - **Access to Entire Memory Map**

GJC/GJL
352-PIN BALL GRID ARRAY (BGA) PACKAGES
(BOTTOM VIEW)



- **Two Multichannel Buffered Serial Ports (McBSPs)**
  - **Direct Interface to T1/E1, MVIP, SCSA Framers**
  - **ST-Bus-Switching Compatible**
  - **Up to 256 Channels Each**
  - **AC97-Compatible**
  - **Serial Peripheral Interface (SPI) Compatible (Motorola™)**
- **Two 32-Bit General-Purpose Timers**
- **Flexible Phase-Locked Loop (PLL) Clock Generator**
- **IEEE-1149.1 (JTAG†) Boundary-Scan Compatible**
- **352-Pin BGA Package (GJC Suffix)**
- **352-Pin BGA Package (GJL Suffix)**
- **CMOS Technology**
  - **0.18-μm/5-Level Metal Process**
- **3.3-V I/Os, 1.8-V Internal**

Table of Contents

description

The TMS320C62x™ DSPs (including the TMS320C6201†) are the fixed-point DSP family in the TMS320C6000™ DSP platform. The C6201 device is based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications. With performance of up to 1600 MIPS at a clock rate of 200 MHz, the C6201 offers cost-effective solutions to high-performance DSP programming challenges. The C6201 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6201 can produce two multiply-accumulates (MACs) per cycle—for a total of 466 million MACs per second (MMACS). The C62x™ DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6201 includes a large bank of on-chip memory and has a powerful and diverse set of peripherals. Program memory consists of a 64K-byte block that is user-configurable as cache or memory-mapped program space. Data memory of the C6201 consists of two 32K-byte blocks of RAM for improved concurrency. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a host-port interface (HPI), and a glueless external memory interface (EMIF) capable of interfacing to SDRAM or SBSRAM and asynchronous peripherals.

The C62x™ DSP has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

TMS320C6000 and C62x are trademarks of Texas Instruments.
Windows is a registered trademark of the Microsoft Corporation.
† The TMS320C6201 device shall be referred to as C6201 throughout the remainder of this document.

device characteristics

Table 1 provides an overview of the C6201 DSP. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count.

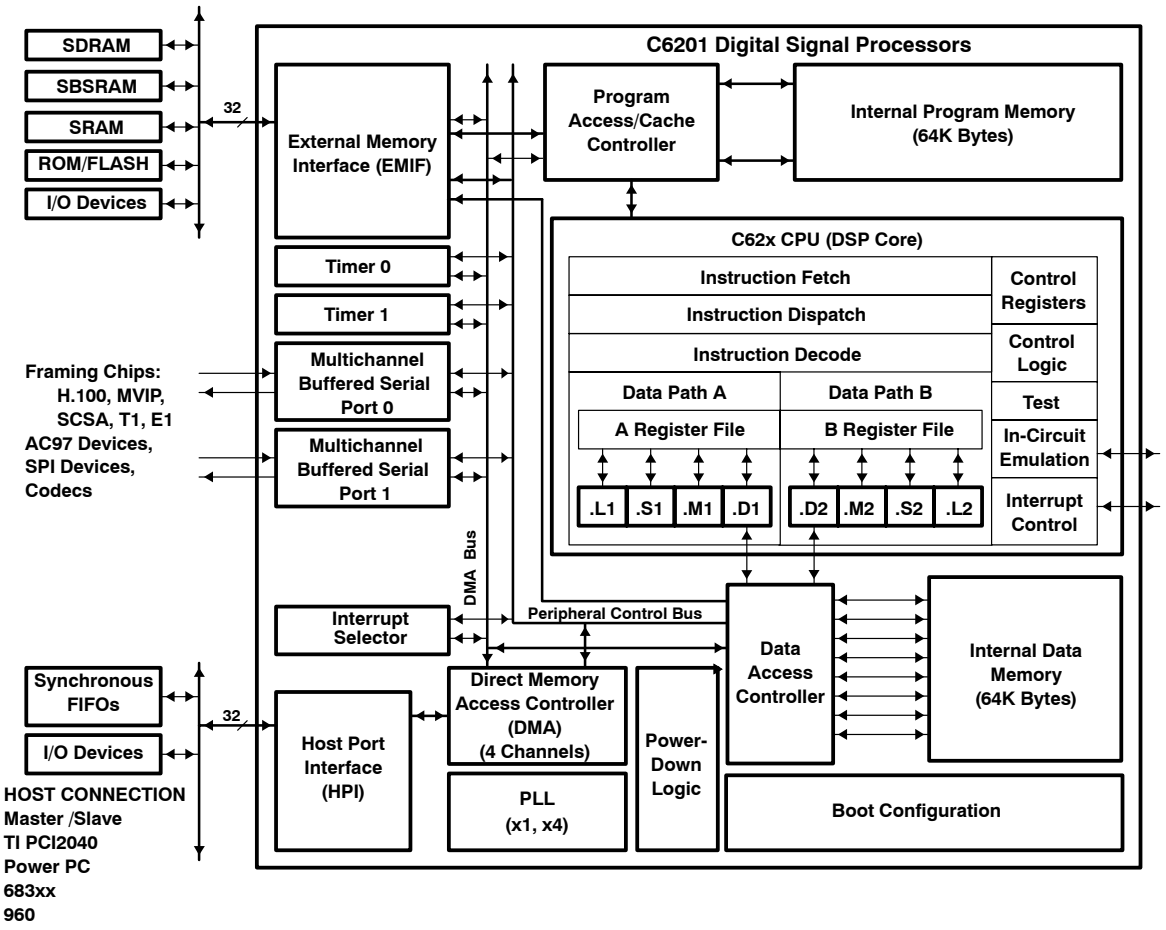
functional and CPU (DSP core) block diagram



CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see functional and CPU (DSP core) block diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

Signal Descriptions

SIGNAL NAME	PIN NO.		TYPE†	DESCRIPTION
	GJC	GJL		
CLOCK/PLL				
CLKIN	C10	B9	I	Clock Input
CLKOUT1	AF22	AC18	O	Clock output at full device speed
CLKOUT2	AF20	AC16	O	Clock output at half of device speed
CLKMODE1	C6	D8	I	Clock mode selects ❑ Selects whether the CPU clock frequency = input clock frequency x4 or x1 For more details on the GJC and GJL CLKMODE pins and the PLL multiply factors, see the *Clock PLL* section of this data sheet.
CLKMODE0	C5	C7		
PLLFREQ3	A9	A9	I	PLL frequency range (3, 2, and 1) ❑ The target range for CLKOUT1 frequency is determined by the 3-bit value of the PLLFREQ pins.
PLLFREQ2	D11	D11		
PLLFREQ1	B10	B10		
PLLV‡	D12	B11	A§	PLL analog V_{CC} connection for the low-pass filter
PLLG‡	C12	C12	A§	PLL analog GND connection for the low-pass filter
PLLF	A11	D12	A§	PLL low-pass filter connection to external components and a bypass capacitor
JTAG EMULATION				
TMS	L3	L3	I	JTAG test port mode select (features an internal pullup)
TDO	W2	U4	O/Z	JTAG test port data out
TDI	R4	T2	I	JTAG test port data in (features an internal pullup)
TCK	R3	R3	I	JTAG test port clock
$\overline{\text{TRST}}$	T1	R4	I	JTAG test port reset (features an internal pulldown)
EMU1	Y1	V3	I/O/Z	Emulation pin 1, pullup with a dedicated 20-kΩ resistor¶
EMU0	W3	W2	I/O/Z	Emulation pin 0, pullup with a dedicated 20-kΩ resistor¶
RESET AND INTERRUPTS				
$\overline{\text{RESET}}$	K2	K2	I	Device reset
NMI	L2	L2	I	Nonmaskable interrupt ❑ Edge-driven (rising edge)
EXT_INT7	U3	U2	I	External interrupts ❑ Edge-driven ❑ Polarity independently selected via the external interrupt polarity register bits (EXTPOL.[3:0])
EXT_INT6	V2	T4		
EXT_INT5	W1	V1		
EXT_INT4	U4	V2		
IACK	Y2	Y1	O	Interrupt acknowledge for all active interrupts serviced by the CPU
INUM3	AA1	V4	O	Active interrupt identification number ❑ Valid during IACK for all active interrupts (not just external) ❑ Encoding order follows the interrupt-service fetch-packet ordering
INUM2	W4	Y2		
INUM1	AA2	AA1		
INUM0	AB1	W4		
LITTLE ENDIAN/BIG ENDIAN				
LENDIAN	H3	G2	I	If high, LENDIAN selects little-endian byte/half-word addressing order within a word If low, LENDIAN selects big-endian addressing
POWER-DOWN STATUS				
PD	D3	E2	O	Power-down mode 2 or 3 (active if high)

† I = Input, O = Output, Z = High Impedance, S = Supply Voltage, GND = Ground

‡ PLLV and PLLG are not part of external voltage supply or ground. See the *clock PLL* section for information on how to connect these pins.

§ A = Analog Signal (PLL Filter)

¶ For emulation and normal operation, pull up EMU1 and EMU0 with a dedicated 20-kΩ resistor. For boundary scan, pull down EMU1 and EMU0 with a dedicated 20-kΩ resistor.

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:
Code Composer Studio™ Integrated Development Environment (IDE) including Editor
C/C++/Assembly Code Generation, and Debug plus additional development tools
Scalable, Real-Time Foundation Software (DSP BIOS), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:
Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)
EVM (Evaluation Module)

The *TMS320 DSP Development Support Reference Guide* (SPRU011) contains information about development-support products for all TMS320™ DSP family member devices, including documentation. See this document for further information on TMS320™ DSP documentation or any TMS320™ DSP support products from Texas Instruments. An additional document, the *TMS320 Third-Party Support Reference Guide* (SPRU052), contains information about TMS320™ DSP-related products from other companies in the industry. To receive TMS320™ DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL) and under “Development Tools”, select “Digital Signal Processors”. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320 DSP devices and support tools. Each TMS320 DSP commerical family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

TMS Fully qualified production device

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GJC or GJL), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -200 is 200 MHz). Figure 4 provides a legend for reading the complete device name for any TMS320C6000 DSP family member.

device and development-support tool nomenclature (continued)

documentation support

Extensive documentation supports all TMS320 DSP family devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000 DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000 CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPIs), multichannel buffered serial ports (McBSPs), direct memory access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XB), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x/C67x™ devices, associated development tools, and third-party support.

The tools support documentation is electronically available within the Code Composer Studio™ IDE. For a complete listing of the latest C6000™ DSP documentation, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL).

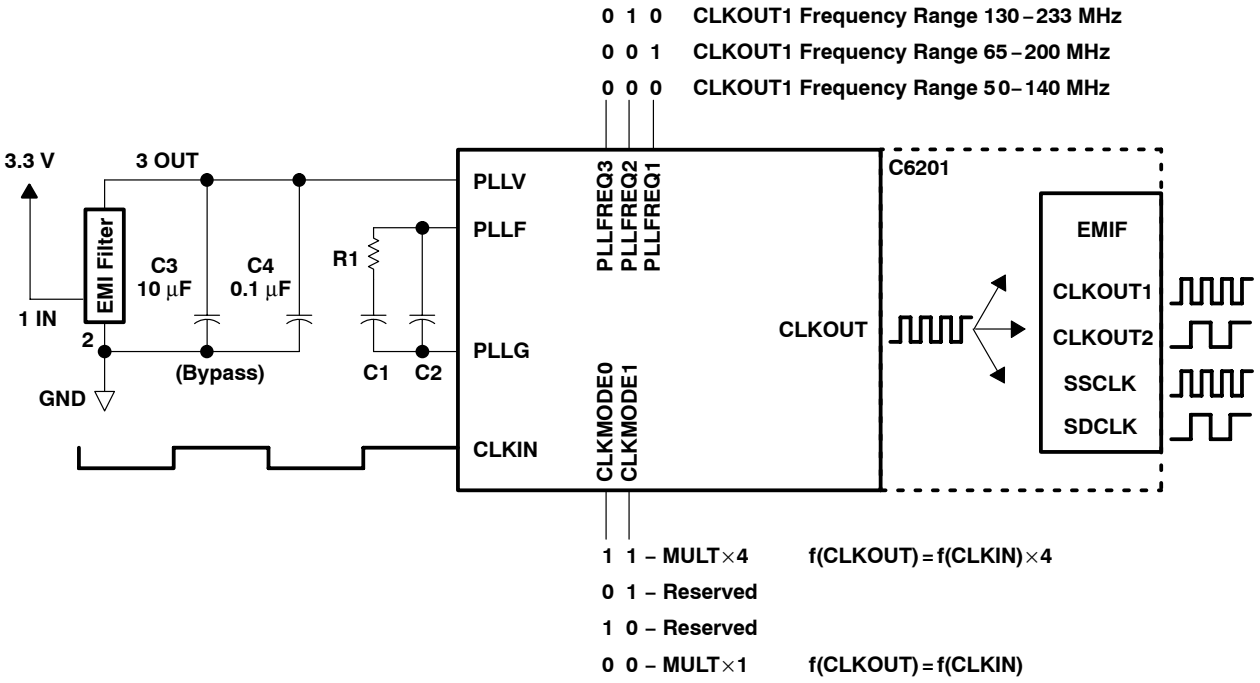
C67x is a trademark of Texas Instruments.

clock PLL

All of the C62x clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which generates the internal CPU clock, or bypasses the PLL to become the CPU clock.

To use the PLL to generate the CPU clock, the filter circuit shown in Figure 5 must be properly designed. Note that for C6201, the EMI filter must be powered by the I/O voltage (3.3 V).

To configure the C62x PLL clock for proper operation, see Figure 5 and Table 2. To minimize the clock jitter, a single clean power supply should power both the C62x DSP device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. See the *input and output clocks* section for input clock timing requirements.



NOTES: A. Keep the lead length and the number of vias between pin PLLF, pin PLLG, R1, C1, and C2 to a minimum. In addition, place all PLL components (R1, C1, C2, C3, C4, and EMI Filter) as close to the C6000™ DSP device as possible. Best performance is achieved with the PLL components on a single side of the board without jumpers, switches, or components other than the ones shown. For CLKMODE x4, values for C1, C2, and R1 are fixed and apply to all valid frequency ranges of CLKIN and CLKOUT.

B. For CLKMODE x1, the PLL is bypassed and all six external PLL components can be removed. For this case, the PLLV terminal has to be connected to a clean supply and the PLLG and PLLF terminals should be tied together.

C. Due to overlap of frequency ranges when choosing the PLLFREQ, more than one frequency range can contain the CLKOUT1 frequency. Choose the lowest frequency range that includes the desired frequency. For example, for CLKOUT1 = 133 MHz, a PLLFREQ value of 000b should be used. For CLKOUT1 = 200 MHz, PLLFREQ should be set to 001b. PLLFREQ values other than 000b, 001b, and 010b are reserved.

D. The 3.3-V supply for the EMI filter (and PLLV) must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.

E. EMI filter manufacturer TDK part number ACF451832-153-T

Figure 5. PLL Block Diagram

clock PLL (continued)

Table 2. PLL Component Selection Table

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 (Ω)	C1 (nF)	C2 (pF)	TYPICAL LOCK TIME (μs)†
x4	12.5–50	50–200	25–100	60.4	27	560	75

† Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

power-down mode logic

Figure 6 shows the power-down mode logic on the C6201.

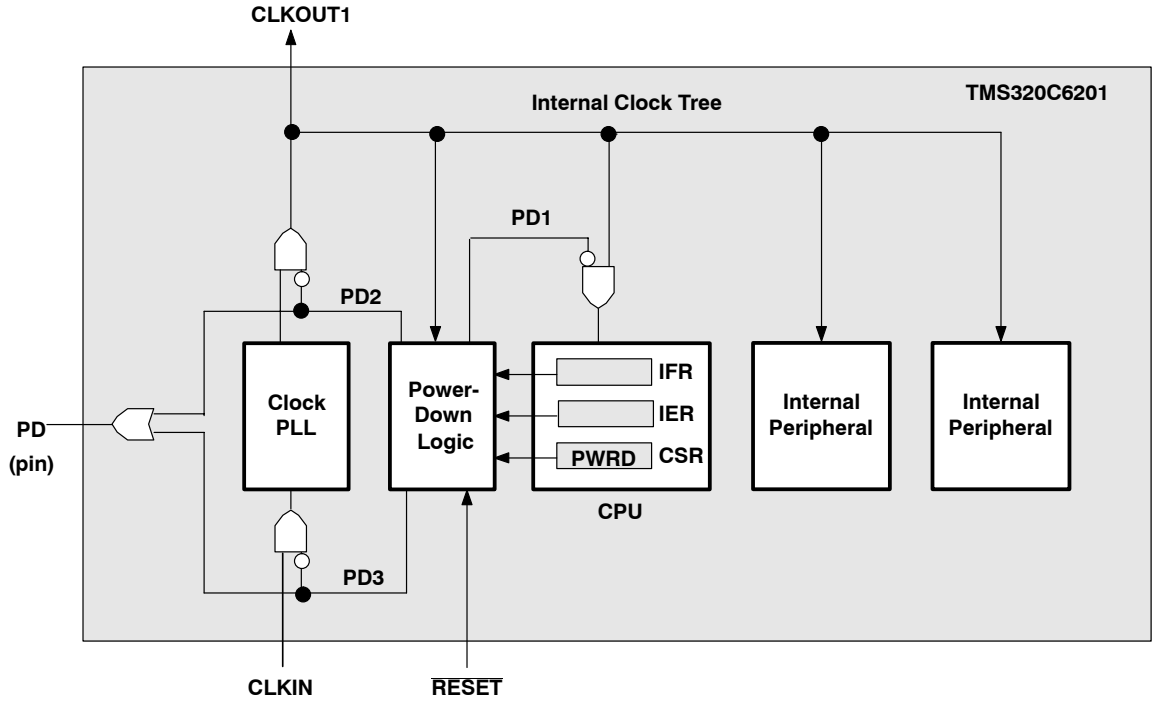


Figure 6. Power-Down Mode Logic†

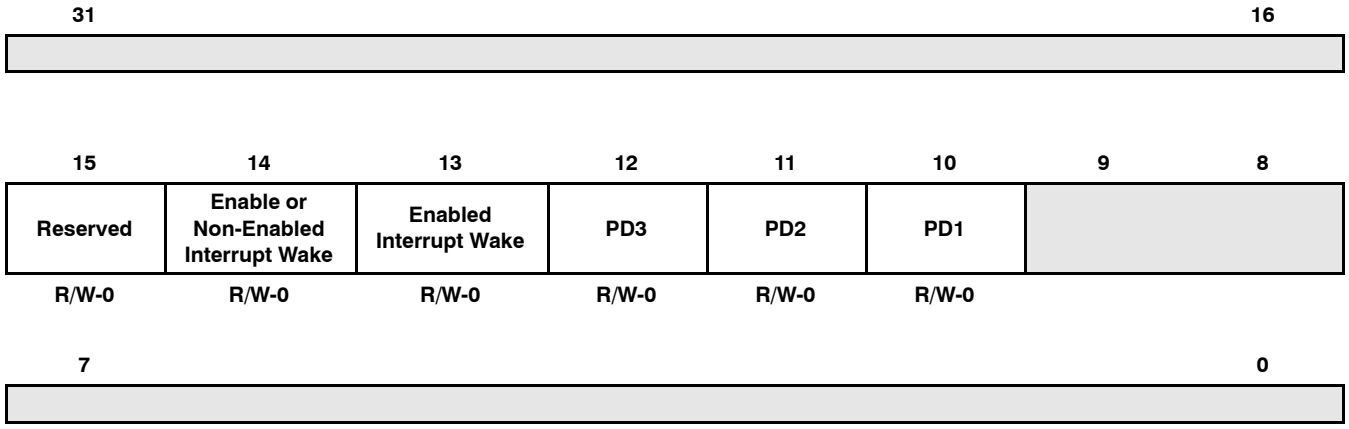
triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 7 and described in Table 3. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when "writing" to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).



Legend: R/W–x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 7. PWRD Field of the CSR Register

Power-down mode PD1 takes effect eight to nine clock cycles after the instruction that sets the PWRD bits in the CSR.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. The GIE bit in CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 3 summarizes all the power-down modes.

Table 3. Characteristics of the Power-Down Modes

PRWD FIELD (BITS 15–10)	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	—
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, DMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2†	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.
011100	PD3†	Wake by a device reset	Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked.
All others	Reserved	—	—

† When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

power-supply design considerations

For systems using the C6000 DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, an external clock pulse may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs Application Report* (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000 platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

absolute maximum ratings over operating case temperature ranges (unless otherwise noted)†

Supply voltage range, CV_{DD} (see Note 1) . . . . . –0.3 V to 2.3 V
Supply voltage range, DV_{DD} (see Note 1) . . . . . –0.3 V to 4 V
Input voltage range . . . . . –0.3 V to 4 V
Output voltage range . . . . . –0.3 V to 4 V
Operating case temperature ranges T_C: (default) . . . . . 0°C to 90°C
(A version) . . . . . –40°C to 105°C
Storage temperature range, T_{stg} . . . . . –65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS}.

recommended operating conditions

			MIN	NOM	MAX	UNIT

4	$t_{t(CKO2)}$	Transition time, CLKOUT2		0.6	ns

† P = 1/CPU clock frequency in ns.
‡ The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.

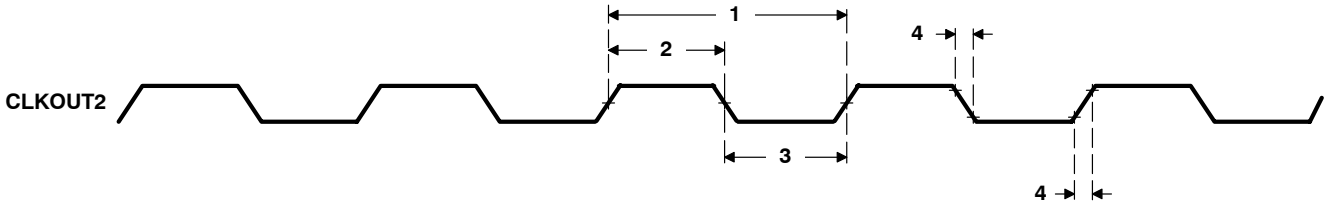

Figure 13. CLKOUT2 Timings

SDCLK, SSCLK timing parameters

SDCLK timing parameters are the same as CLKOUT2 parameters.

SSCLK timing parameters are the same as CLKOUT1 or CLKOUT2 parameters, depending on SSCLK configuration.

switching characteristics over recommended operating conditions for the relation of SSCLK, SDCLK, and CLKOUT2 to CLKOUT1 (see Figure 14)†

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
1	$t_{d(CKO1-SSCLK)}$	Delay time, CLKOUT1 edge to SSCLK edge	(P/2) + 0.2	(P/2) + 4.2	ns
2	$t_{d(CKO1-SSCLK1/2)}$	Delay time, CLKOUT1 edge to SSCLK edge (1/2 clock rate)	(P/2) – 1	(P/2) + 2.4	ns
3	$t_{d(CKO1-CKO2)}$	Delay time, CLKOUT1 edge to CLKOUT2 edge	(P/2) – 1	(P/2) + 2.4	ns
4	$t_{d(CKO1-SDCLK)}$	Delay time, CLKOUT1 edge to SDCLK edge	(P/2) – 1	(P/2) + 2.4	ns

† P = 1/CPU clock frequency in ns.

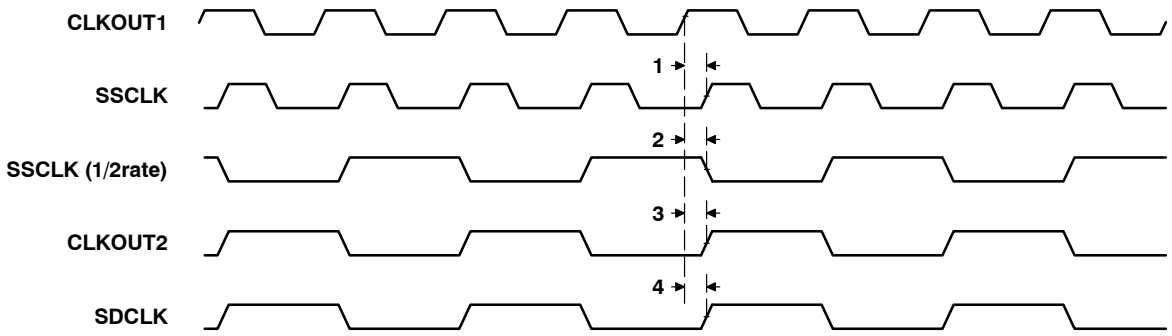

Figure 14. Relation of CLKOUT2, SDCLK, and SSCLK to CLKOUT1

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles† (see Figure 15 and Figure 16)

NO.			–200		UNIT
			MIN	MAX	
6	$t_{su(EDV-CKO1H)}$	Setup time, read EDx valid before CLKOUT1 high	4		ns
7	$t_{h(CKO1H-EDV)}$	Hold time, read EDx valid after CLKOUT1 high	0.8		ns
10	$t_{su(ARDY-CKO1H)}$	Setup time, ARDY valid before CLKOUT1 high	3		ns
11	$t_{h(CKO1H-ARDY)}$	Hold time, ARDY valid after CLKOUT1 high	1.8		ns

† To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

switching characteristics over recommended operating conditions for asynchronous memory cycles‡ (see Figure 15 and Figure 16)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
1	$t_{d(CKO1H-CEV)}$	Delay time, CLKOUT1 high to $\overline{CE}$x valid	–0.2	4	ns
2	$t_{d(CKO1H-BEV)}$	Delay time, CLKOUT1 high to $\overline{BE}$x valid		4	ns
3	$t_{d(CKO1H-BEIV)}$	Delay time, CLKOUT1 high to $\overline{BE}$x invalid	–0.2		ns
4	$t_{d(CKO1H-EAV)}$	Delay time, CLKOUT1 high to EAx valid		4	ns
5	$t_{d(CKO1H-EAIV)}$	Delay time, CLKOUT1 high to EAx invalid	–0.2		ns
8	$t_{d(CKO1H-AOEV)}$	Delay time, CLKOUT1 high to $\overline{AOE}$ valid	–0.2	4	ns
9	$t_{d(CKO1H-AREV)}$	Delay time, CLKOUT1 high to $\overline{ARE}$ valid	–0.2	4	ns
12	$t_{d(CKO1H-EDV)}$	Delay time, CLKOUT1 high to EDx valid		4	ns
13	$t_{d(CKO1H-EDIV)}$	Delay time, CLKOUT1 high to EDx invalid	–0.2		ns
14	$t_{d(CKO1H-AWEV)}$	Delay time, CLKOUT1 high to $\overline{AWE}$ valid	–0.2	4	ns

‡ The minimum delay is also the minimum output hold after CLKOUT1 high.

HOLD/HOLDA TIMING

timing requirements for the HOLD/HOLDA cycles† (see Figure 27)

NO.			–200		UNIT
			MIN	MAX	
1	$t_{su(HOLDH-CKO1H)}$	Setup time, HOLD high before CLKOUT1 high	1		ns
2	$t_{h(CKO1H-HOLDL)}$	Hold time, HOLD low after CLKOUT1 high	4		ns

† HOLD is synchronized internally. Therefore, if setup and hold times are not met, it will either be recognized in the current cycle or in the next cycle. Thus, HOLD can be an asynchronous input.

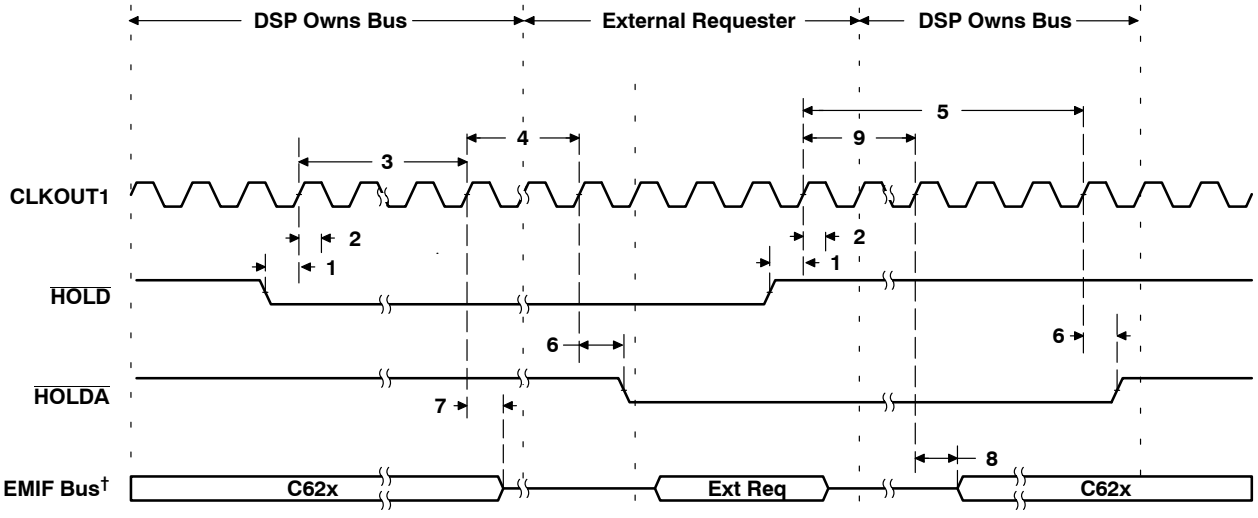
switching characteristics over recommended operating conditions for the HOLD/HOLDA cycles‡ (see Figure 27)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
3	$t_{d(HOLDL-BHZ)}$	Delay time, HOLD low to EMIF Bus high impedance	4P	§	ns
4	$t_{d(BHZ-HOLDAL)}$	Delay time, EMIF Bus high impedance to HOLDA low	P	2P	ns
5	$t_{d(HOLDH-HOLDAH)}$	Delay time, HOLD high to HOLDA high	4P	7P	ns
6	$t_{d(CKO1H-HOLDAL)}$	Delay time, CLKOUT1 high to HOLDA valid	1	8	ns
7	$t_{d(CKO1H-BHZ)}$	Delay time, CLKOUT1 high to EMIF Bus high impedance¶	3	11	ns
8	$t_{d(CKO1H-BLZ)}$	Delay time, CLKOUT1 high to EMIF Bus low impedance¶	3	11	ns
9	$t_{d(HOLDH-BLZ)}$	Delay time, HOLD high to EMIF Bus low impedance	3P	6P	ns

‡ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

§ All pending EMIF transactions are allowed to complete before HOLDA is asserted. The worst cases for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when RBTR8 = 1. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

¶ EMIF Bus consists of CE[3:0], BE[3:0], ED[31:0], EA[21:2], ARE, AOE, AWE, SSADS, SSOE, SSWE, SDA10, SDRAS, SDCAS, and SDWE.



† EMIF Bus consists of CE[3:0], BE[3:0], ED[31:0], EA[21:2], ARE, AOE, AWE, SSADS, SSOE, SSWE, SDA10, SDRAS, SDCAS, and SDWE.

Figure 27. HOLD/HOLDA Timing

RESET TIMING

timing requirements for reset (see Figure 28)

NO.			–200		UNIT
			MIN	MAX	
1	$t_{w(RST)}$	Width of the $\overline{\text{RESET}}$ pulse (PLL stable)†	10		CLKOUT1 cycles
		Width of the $\overline{\text{RESET}}$ pulse (PLL needs to sync up)‡	250		µs

† This parameter applies to CLKMODE x1 when CLKIN is stable and applies to CLKMODE x4 when CLKIN and PLL are stable.

‡ This parameter only applies to CLKMODE x4. The $\overline{\text{RESET}}$ signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 µs to stabilize following device power up or after PLL configuration has been changed. During that time, $\overline{\text{RESET}}$ must be asserted to ensure proper device operation. See the *Clock PLL* section for PLL lock times.

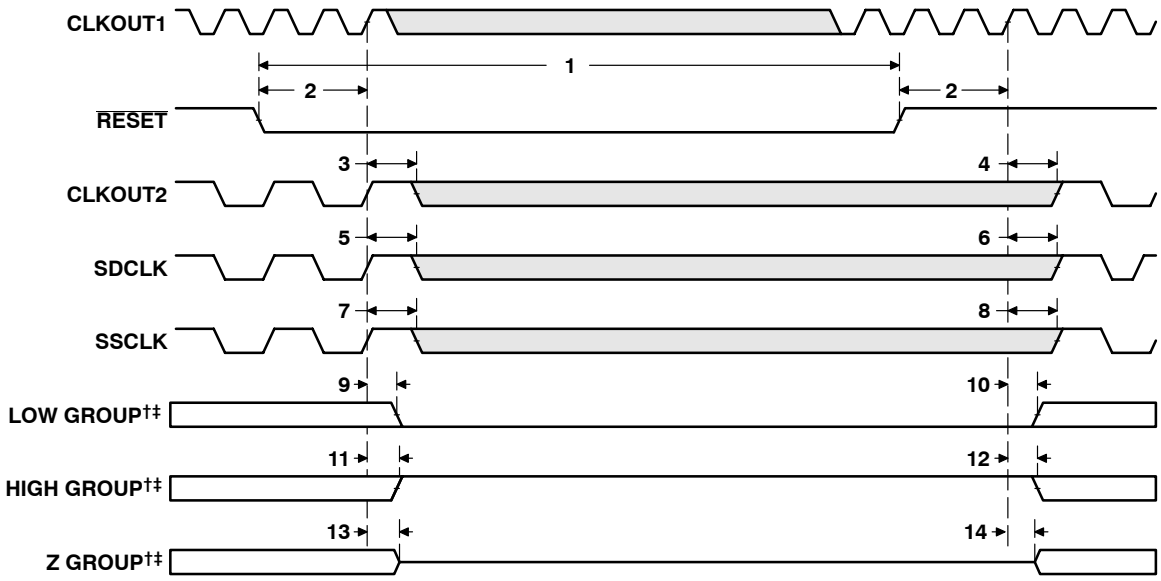
switching characteristics over recommended operating conditions during reset§¶ (see Figure 28)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
2	$t_{R(RST)}$	Response time to change of value in $\overline{\text{RESET}}$ signal	2		CLKOUT1 cycles
3	$t_{d(CKO1H-CKO2IV)}$	Delay time, CLKOUT1 high to CLKOUT2 invalid	–1		ns
4	$t_{d(CKO1H-CKO2V)}$	Delay time, CLKOUT1 high to CLKOUT2 valid		10	ns
5	$t_{d(CKO1H-SDCLKIV)}$	Delay time, CLKOUT1 high to SDCLK invalid	–1		ns
6	$t_{d(CKO1H-SDCLKV)}$	Delay time, CLKOUT1 high to SDCLK valid		10	ns
7	$t_{d(CKO1H-SSCKIV)}$	Delay time, CLKOUT1 high to SSCLK invalid	–1		ns
8	$t_{d(CKO1H-SSCKV)}$	Delay time, CLKOUT1 high to SSCLK valid		10	ns
9	$t_{d(CKO1H-LOWIV)}$	Delay time, CLKOUT1 high to low group invalid	–1		ns
10	$t_{d(CKO1H-LOWV)}$	Delay time, CLKOUT1 high to low group valid		10	ns
11	$t_{d(CKO1H-HIGHIV)}$	Delay time, CLKOUT1 high to high group invalid	–1		ns
12	$t_{d(CKO1H-HIGHV)}$	Delay time, CLKOUT1 high to high group valid		10	ns
13	$t_{d(CKO1H-ZHZ)}$	Delay time, CLKOUT1 high to Z group high impedance	–1		ns
14	$t_{d(CKO1H-ZV)}$	Delay time, CLKOUT1 high to Z group valid		10	ns

§ Low group consists of: IACK, INUM[3:0], DMAC[3:0], PD, TOUT0, and TOUT1
High group consists of: $\overline{\text{HINT}}$
Z group consists of: EA[21:2], ED[31:0], $\overline{\text{CE}}$[3:0], $\overline{\text{BE}}$[3:0], $\overline{\text{ARE}}$, $\overline{\text{AWE}}$, $\overline{\text{AOE}}$, $\overline{\text{SSADS}}$, $\overline{\text{SSOE}}$, $\overline{\text{SSWE}}$, SDA10, $\overline{\text{SDRAS}}$, $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, HD[15:0], CLKX0, CLKX1, FSX0, FSX1, DX0, DX1, CLKR0, CLKR1, FSR0, and FSR1.

¶ $\overline{\text{HRDY}}$ is gated by input $\overline{\text{HCS}}$.
If $\overline{\text{HCS}}$ = 0 at device reset, $\overline{\text{HRDY}}$ belongs to the high group.
If $\overline{\text{HCS}}$ = 1 at device reset, $\overline{\text{HRDY}}$ belongs to the low group.

RESET TIMING (CONTINUED)



† Low group consists of: IACK, INUM[3:0], DMAC[3:0], PD, TOUT0, and TOUT1
High group consists of: HINT
Z group consists of: EA[21:2], ED[31:0], CE[3:0], BE[3:0], ARE, AWE, AOE, SSADS, SSOE, SSWE, SDA10, SDRAS, SDCAS, SDWE, HD[15:0], CLKX0, CLKX1, FSX0, FSX1, DX0, DX1, CLKR0, CLKR1, FSR0, and FSR1.

‡ HRDY is gated by input HCS.
If HCS = 0 at device reset, HRDY belongs to the high group.
If HCS = 1 at device reset, HRDY belongs to the low group.

Figure 28. Reset Timing

EXTERNAL INTERRUPT TIMING

timing requirements for interrupt response cycles†‡ (see Figure 29)

NO.			–200		UNIT
			MIN	MAX	
2	$t_{w(ILOW)}$	Width of the interrupt pulse low	2P		ns
3	$t_{w(IHIGH)}$	Width of the interrupt pulse high	2P		ns

† Interrupt signals are synchronized internally and are potentially recognized one cycle later if setup and hold times are violated. Thus, they can be connected to asynchronous inputs.

‡ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

switching characteristics over recommended operating conditions during interrupt response cycles§ (see Figure 29)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
1	$t_{d(EINTH-IACKH)}$	Delay time, EXT_INTx high to IACK high	9P		ns
4	$t_{d(CKO2L-IACKV)}$	Delay time, CLKOUT2 low to IACK valid	–4	6	ns
5	$t_{d(CKO2L-INUMV)}$	Delay time, CLKOUT2 low to INUMx valid		6	ns
6	$t_{d(CKO2L-INUMIV)}$	Delay time, CLKOUT2 low to INUMx invalid	–4		ns

§ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.
When the PLL is used (CLKMODE x4), 0.5P = 1/(2 × CPU clock frequency).
For CLKMODE x1: 0.5P = PH, where PH is the high period of CLKIN.

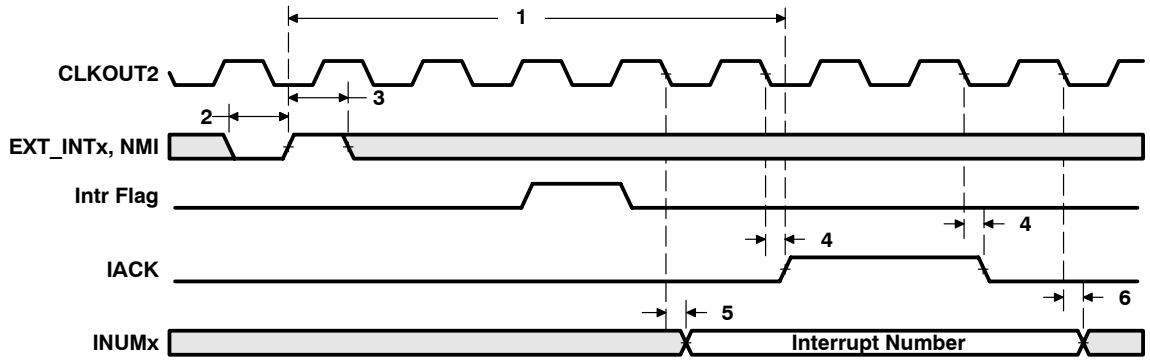


Figure 29. Interrupt Timing

HOST-PORT INTERFACE TIMING

timing requirements for host-port interface cycles†‡ (see Figure 30, Figure 31, Figure 32, and Figure 33)

NO.			–200		UNIT
			MIN	MAX	
1	$t_{su(SEL-HSTBL)}$	Setup time, select signals§ valid before $\overline{\text{HSTROBE}}$ low	4		ns
2	$t_{h(HSTBL-SEL)}$	Hold time, select signals§ valid after $\overline{\text{HSTROBE}}$ low	2		ns
3	$t_{w(HSTBL)}$	Pulse duration, $\overline{\text{HSTROBE}}$ low	2P		ns
4	$t_{w(HSTBH)}$	Pulse duration, $\overline{\text{HSTROBE}}$ high between consecutive accesses	2P		ns
10	$t_{su(SEL-HASL)}$	Setup time, select signals§ valid before $\overline{\text{HAS}}$ low	4		ns
11	$t_{h(HASL-SEL)}$	Hold time, select signals§ valid after $\overline{\text{HAS}}$ low	2		ns
12	$t_{su(HDV-HSTBH)}$	Setup time, host data valid before $\overline{\text{HSTROBE}}$ high	3		ns
13	$t_{h(HSTBH-HDV)}$	Hold time, host data valid after $\overline{\text{HSTROBE}}$ high	2		ns
14	$t_{h(HRDYL-HSTBL)}$	Hold time, $\overline{\text{HSTROBE}}$ low after $\overline{\text{HRDY}}$ low. $\overline{\text{HSTROBE}}$ shoul not be inactivated until $\overline{\text{HRDY}}$ is active (low); otherwise, HPI writes will not complete properly.	1		ns
18	$t_{su(HASL-HSTBL)}$	Setup time, $\overline{\text{HAS}}$ low before $\overline{\text{HSTROBE}}$ low	2		ns
19	$t_{h(HSTBL-HASL)}$	Hold time, $\overline{\text{HAS}}$ low after $\overline{\text{HSTROBE}}$ low	2		ns

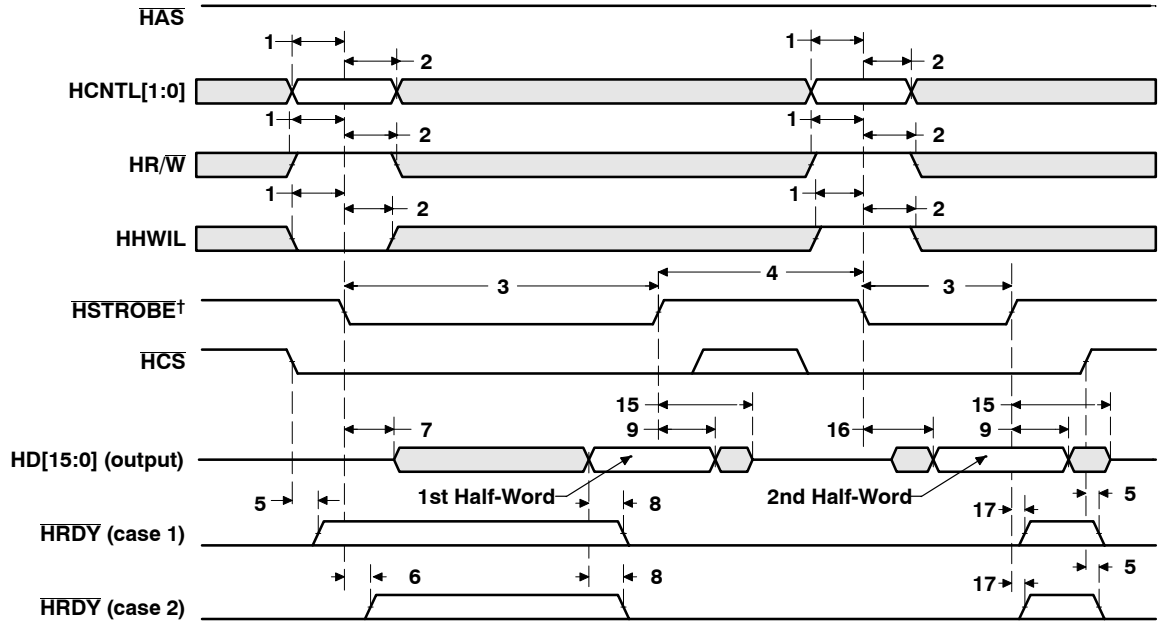
† $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: [NOT($\overline{\text{HDS1}}$ XOR $\overline{\text{HDS2}}$)] OR $\overline{\text{HCS}}$.
‡ The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.
§ Select signals include: HCNTRL[1:0], HR/$\overline{\text{W}}$, and HHWIL.

switching characteristics over recommended operating conditions during host-port interface cycles†‡ (see Figure 30, Figure 31, Figure 32, and Figure 33)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
5	$t_{d(HCS-HRDY)}$	Delay time, $\overline{\text{HCS}}$ to $\overline{\text{HRDY}}$¶	1	9	ns
6	$t_{d(HSTBL-HRDYH)}$	Delay time, $\overline{\text{HSTROBE}}$ low to $\overline{\text{HRDY}}$ high#	3	12	ns
7	$t_{oh(HSTBL-HDLZ)}$	Output hold time, HD low impedance after $\overline{\text{HSTROBE}}$ low for an HPI read	4		ns
8	$t_{d(HDV-HRDYL)}$	Delay time, HD valid to $\overline{\text{HRDY}}$ low	P – 3	P + 3	ns
9	$t_{oh(HSTBH-HDV)}$	Output hold time, HD valid after $\overline{\text{HSTROBE}}$ high	2	12	ns
15	$t_{d(HSTBH-HDHZ)}$	Delay time, $\overline{\text{HSTROBE}}$ high to HD high impedance	3	12	ns
16	$t_{d(HSTBL-HDV)}$	Delay time, $\overline{\text{HSTROBE}}$ low to HD valid	2	12	ns
17	$t_{d(HSTBH-HRDYH)}$	Delay time, $\overline{\text{HSTROBE}}$ high to $\overline{\text{HRDY}}$ high‖	3	12	ns
20	$t_{d(HASL-HRDYH)}$	Delay time, $\overline{\text{HAS}}$ low to $\overline{\text{HRDY}}$ high	3	12	ns

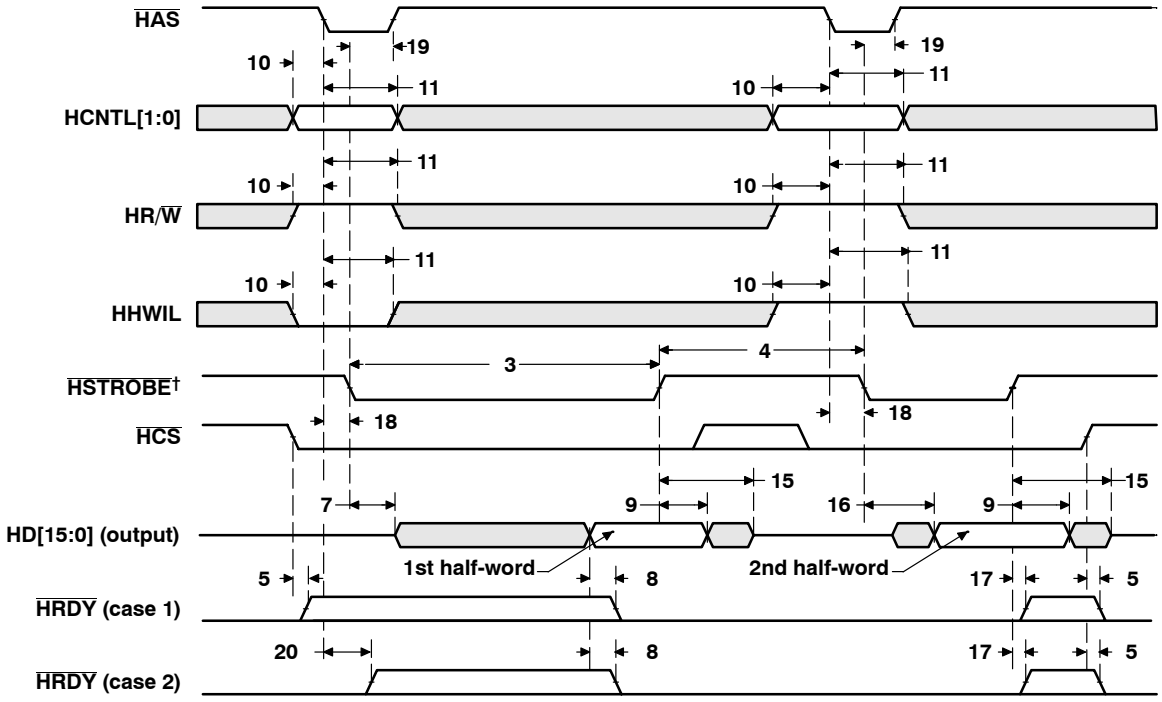
† $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: [NOT($\overline{\text{HDS1}}$ XOR $\overline{\text{HDS2}}$)] OR $\overline{\text{HCS}}$.
‡ The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.
¶ $\overline{\text{HCS}}$ enables $\overline{\text{HRDY}}$, and $\overline{\text{HRDY}}$ is always low when $\overline{\text{HCS}}$ is high. The case where $\overline{\text{HRDY}}$ goes high when $\overline{\text{HCS}}$ falls indicates that HPI is busy completing a previous HPID write or READ with autoincrement.
# This parameter is used during an HPID read. At the beginning of the first half-word transfer on the falling edge of $\overline{\text{HSTROBE}}$, the HPI sends the request to the DMA auxiliary channel, and $\overline{\text{HRDY}}$ remains high until the DMA auxiliary channel loads the requested data into HPID.
‖ This parameter is used after the second half-word of an HPID write or autoincrement read. $\overline{\text{HRDY}}$ remains low if the access is not an HPID write or autoincrement read. Reading or writing to HPIC or HPIA does not affect the $\overline{\text{HRDY}}$ signal.

HOST-PORT INTERFACE TIMING (CONTINUED)



† HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

Figure 30. HPI Read Timing (HAS Not Used, Tied High)



† HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

Figure 33. HPI Write Timing (HAS Used)

MULTICHANNEL BUFFERED SERIAL PORT TIMING

timing requirements for McBSP†‡(see Figure 34)

NO.				–200		UNIT
				MIN	MAX	
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P§		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P – 1¶		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	9		ns
			CLKR ext	2		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	3		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	8		ns
			CLKR ext	0		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	4		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	9		ns
			CLKX ext	2		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	3		

† CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

‡ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

§ The maximum bit rate for the C6202/02B/03 device is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz (P = 5 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

¶ The minimum CLKR/X pulse duration is either (P – 1) or 4 ns, whichever is larger. For example, when running parts at 200 MHz (P = 5 ns), use 4 ns as the minimum CLKR/X pulse duration. When running parts at 100 MHz (P = 10 ns), use (P – 1) = 9 ns as the minimum CLKR/X pulse duration.

13	$t_{d(CKXH-DXV)}$	Delay time, CLKX high to DX valid	CLKX int	–1	4	ns
			CLKX ext	3	9	
14	$t_{d(FXH-DXV)}$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int	–1	3	ns
			FSX ext	3	9	

† CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

‡ Minimum delay times also represent minimum output hold times.

§ P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

¶ The maximum bit rate for the C6202/02B/03 device is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz (P = 5 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

# C = H or L
S = sample rate generator input clock = P if CLKSM = 1 (P = 1/CPU clock frequency)
= sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPR051G device-specific data sheet to make it an SPRS051H revision.

Scope: Applicable updates to the C62x device family, specifically relating to the C6201 device, have been incorporated.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
All	Updated the title for literature number SPRU190 to: TMS320C6000 DSP Peripherals Overview Reference Guide
25	Added the power-down mode logic section and accompanying information.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
