

TPS53126 Dual Synchronous Step-down Controller For Low Voltage Power Rails

1 Features

- D-CAP2™ Mode Control
 - Fast Transient Response
 - No External Parts Required For Loop Compensation
 - Compatible with Ceramic Output Capacitors
- High Initial Reference Accuracy ($\pm 1\%$)
- Low Output Ripple
- Wide Input Voltage Range: 4.5 V to 24 V
- Output Voltage Range: 0.76 V to 5.5 V
- Low-Side $R_{DS(on)}$ Loss-Less Current Sensing
- Adaptive Gate Drivers with Integrated Boost Diode
- Internal 1.2 ms Voltage-Servo Soft Start
- Pre-Biased Soft Start
- Selectable Switching Frequency: 350 kHz / 700 kHz
- Cycle-by-Cycle Over-Current Limiting Control
- 30 mV to 300 mV OCP Threshold Voltage
- Thermally Compensated OCP by 4000 ppm/C° at I_{TRIP}

2 Applications

- Point-of-Load Regulation in Low Power Systems for Wide Range of Applications
 - Digital TV Power Supply
 - Networking Home Terminal
 - Digital Set Top Box (STB)
 - DVD Player/Recorder
 - Gaming Consoles and Other

4 Simplified Schematics

3 Description

The TPS53126 is a dual, adaptive on-time, D-CAP2™ mode synchronous Buck controller. The TPS53126 enables system designers to complete the suite of various end equipment's power bus regulators with a cost effective, low external component count, and low standby current solution. The main control loop for the TPS53126 uses the D-CAP2™ mode control which provides a very fast transient response with no external components. The TPS53126 also has a proprietary circuit that enables the device to adapt to both low equivalent series resistance (ESR) output capacitors, such as POSCAP or SP-CAP, and ultra-low ESR ceramic capacitors. The device provides convenient and efficient operation with input voltages from 4.5 V to 24 V and output voltages from 0.76 V to 5.5 V.

The TPS53126 is available in 4mm x 4mm 24 pin VQFN (RGE) or 24 pin TSSOP (PW) packages and is specified from -40°C to 85°C ambient temperature range.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS53126	VQFN (24)	4.00 mm x 4.00 mm
TPS53126	TSSOP (24)	7.80 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

5 Revision History

Changes from Revision A (July 2013) to Revision B

Page

• Changed the datasheet to the new TI standard format	1
• Replaced QFN and TSSOP schematics	1
• Changed V_{VREG5} MIN from 4.8 V to 4.6 V	5
• Changed R_{DRVL} Source, $I_{DRVLx} = -100$ mA MAX from 8 Ω to 12 Ω	5
• Added Design Parameter and Detailed Design Procedure sections	19

Changes from Original (May 2009) to Revision A

Page

• Changed Equation 1	12
• Changed Equation 13	16

6 Pin Configurations and Functions

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	VQFN 24 NUMBER	TSSOP 24 NUMBER		
VBST1, VBST2	23, 8	2, 11	I	Supply input for high-side NFET driver (Boost Terminal). Bypass to SWx with a high-quality 0.1µF ceramic capacitor. An external schottky diode can be added if forward drop is critical to drive the high-side FET.
EN1, EN2	24, 7	3, 10	I	Channel 1 and channel 2 high level enable pins.
VO1, VO2	1, 6	4, 9	I	Output voltage inputs for on-time adjustment and output discharge. Connect directly to the output voltage.
VFB1, VFB2	2, 5	5, 8	I	D-CAP2 feedback inputs. Connect to output voltage with resistor divider.
GND	3	6	I	Signal ground pin. Connect to PGND1, PGND2 and system ground at a single point.
DRVH1, DRVH2	22, 9	1, 12	O	High-side MOSFET gate driver outputs. SWx referenced drivers switch between SWx (OFF) and VBSTx (ON).
SW1, SW2	21, 10	24, 13	I/O	Switch node connections for both the high-side drivers and the current comparators.
DRVL1, DRVL2	20, 11	23, 14	O	Low-side MOSFET gate driver outputs. PGND referenced drivers switch between PGNDx (OFF) and VREG5 (ON).
PGND1, PGND2	19, 12	22, 15	I/O	Power ground connections for both the low-side drivers and the current comparators. Connect PGND1, PGND2 and GND strongly together near the IC.
TRIP1, TRIP2	18, 13	21, 16	I	Over current trip point programming pin. Connect to GND with a resistor to GND to set threshold for low-side R _{DS(on)} current limit.
VIN	17	20	I	Supply Input for 5V linear regulator.
V5FILT	15	18	I	5V supply input for the entire control circuit except the MOSFET drivers. Bypass to GND with a minimum 1.0µF, high-quality ceramic capacitor. V5FILT is connected to VREG5 via an internal 10Ω resistor.
VREG5	16	19	O	Output of 5V linear regulator and supply for MOSFET drivers. Bypass to GND with a minimum 4.7µF high-quality ceramic capacitor. VREG5 is connected to V5FILT via an internal 10Ω resistor.
TEST1	4	7	O	Test interface pin, not used during application. Connect directly to GND.
TEST2	14	17	I	Frequency select pin. Connect to GND for 350kHz switching. Connect to V5FILT for 700kHz switching.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

			MIN	MAX	UNIT
	Input voltage	VIN, EN1, EN2	-0.3	26	V
		VBST1, VBST2	-0.3	32	
		VBST1, VBST2 (wrt SWx)	-0.3	6	
		V5FILT, VFB1, VFB2, TRIP1, TRIP2, VO1, VO2, TEST1, TEST2	-0.3	6	
		SW1, SW2	-2	26	
	Output voltage	DRVH1, DRVH2	-1	32	V
		DRVH1, DRVH2 (wrt SWx)	-0.3	6	
		DRVL1, DRVL2, VREG5	-0.3	6	
		PGND1, PGND2	-0.3	0.3	
T _A	Operating ambient temperature range		-40	85	°C
T _J	Junction temperature range		-40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 Handling Ratings

			MIN	MAX	UNIT
T _{stg}	Storage temperature range		-55	150	°C
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	-2000	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	-500	500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

			MIN	MAX	UNIT
	Supply input voltage range	VIN	4.5	24	V
		V5FILT	4.5	5.5	
	Input voltage range	VBST1, VBST2	-0.1	30	V
		VBST1, VBST2 (wrt SWx)	-0.1	5.5	
		VFB1, VFB2, VO1, VO2, TEST1, TEST2	-0.1	5.5	
		TRIP1, TRIP2	-0.1	0.3	
		EN1, EN2	-0.1	24	
		SW1, SW2	-1.8	24	
	Output voltage range	DRVH1, DRVH2	-0.1	30	V
		VBST1, VBST2 (wrt SWx)	-0.1	5.5	
		DRVL1, DRVL2, VREG5	-0.1	5.5	
		PGND1, PGND2	-0.1	0.1	
T _A	Operating free-air temperature		-40	85	°C
T _J	Operating junction temperature		-40	125	°C

8 Detailed Description

8.1 Overview

The TPS53126 is a dual, adaptive on-time, D-CAP2™ mode synchronous Buck controller. The TPS53126 enables system designers to complete the suite of various end equipment's power bus regulators with a cost effective, low external component count, and low standby current solution. The main control loop for the TPS53126 uses the D-CAP2™ mode control which provides a very fast transient response with no external components. The TPS53126 also has a proprietary circuit that enables the device to adapt to both low equivalent series resistance (ESR) output capacitors, such as POSCAP or SP-CAP, and ultra-low ESR ceramic capacitors. The device provides convenient and efficient operation with input voltages from 4.5 V to 24 V and output voltages from 0.76 V to 5.5 V.

8.2 Functional Block Diagram

Functional Block Diagram (continued)

8.3 Feature Description

8.3.1 PWM Operation

The main control loop of the TPS53126 is an adaptive on-time pulse width modulation (PWM) controller that supports a proprietary D-CAP2 mode control. D-CAP2 Mode control combines constant on-time control with an internal compensation circuit for pseudo-fixed frequency and low external component count configuration with both low ESR and ceramic output capacitors. It is stable even with virtually no ripple at the output.

At the beginning of each cycle, the high-side MOSFET is turned on. This MOSFET is turned off after internal one shot timer expires. This one shot timer is set by the converter input voltage, V_{IN} , and the output voltage, V_O , to maintain a pseudo-fixed frequency over the input voltage range, hence it is called adaptive on-time control. The one-shot timer is reset and the high-side MOSFET is turned on again when the feedback voltage falls below the reference voltage. An internal ramp is added to the reference voltage to simulate output ripple, eliminating the need for ESR induced output ripple from D-CAP mode control.

8.3.2 Drivers

Each SMPS of the TPS53126 contains 2 high-current resistive MOSFET drivers. The Low-side driver is a ground referenced, VREG5 powered driver designed to drive the gate of a high-current, low $R_{DS(on)}$ N-channel MOSFET whose source is connected to PGND. The High-side Driver is a floating SW referenced VBST powered driver designed to drive the gate of a high-current, low $R_{DS(on)}$ N-channel MOSFET. To maintain the BST voltage during the high-side driver ON time, a capacitor is placed from SW to VBST. Each driver draws average current equal to Gate Charge (Q_g AT $V_{gs} = 5V$) times Switching Frequency (f_{sw}).

To prevent cross-conduction, there is a narrow dead-time when both high-side and low-side drivers are OFF between each driver transition. During this time the inductor current is carried by one of the MOSFETs body diodes.

Feature Description (continued)

8.3.3 PWM Frequency And Adaptive On-time Control

The TPS53126 uses an adaptive on-time control scheme and does not have a dedicated on board oscillator. The TPS53126 runs with pseudo-constant frequency by using the input voltage and output voltage to set the on-time one-shot timer. The on-time is inversely proportional to the input voltage and proportional to the output voltage, therefore, when the duty ratio is V_{OUT}/V_{IN} , the frequency is constant.

8.3.4 5 Volt Regulator

The TPS53126 has an internal 5V Low-Dropout (LDO) Regulator to provide a regulated voltage for all four drivers and the IC's internal logic. A capacitor from VREG5 to GND is required to stabilize the internal regular. An internal 10Ω resistor from VREG5 filters the regulator output to the IC's analog and logic input voltage, V5FILT. An additional capacitor is required from V5FILT to GND to filter switching noise from VREG5.

8.3.5 Soft Start

The TPS53126 has an internal, 1.2ms, voltage servo soft-start for each channel. When the ENx pin becomes high, an internal DAC begins ramping up the reference voltage to the PWM comparator. Smooth control of the output voltage is maintained during start up. As the TPS53126 shares one DAC with both channels, if ENx pin is set to high while another channel is starting up, soft start is postponed until another channel soft start has completed. If both of EN1 and EN2 are set high at a same time, both channels start up at same time.

8.3.6 Pre-Bias Support

The TPS53126 supports pre-bias start-up without sinking current from the output capacitor. When enabled, the low-side driver is held off until the soft-start commands a voltage higher than the pre-bias level (internal soft-start becomes greater than feedback voltage [VFB]), then the TPS53126 slowly activates synchronous rectification by limiting the first DRV1 pulses with a narrow on-time. This limited on-time is then incremented on a cycle-by-cycle basis until it coincides with the full 1-D off-time. This scheme prevents the initial sinking of current from the pre-bias output, and ensure that the output voltage (VOUT) starts and ramps up smoothly into regulation and the control loop is given time to transition from pre-biased start-up to normal mode operation.

8.3.7 Switching Frequency Selection

The TPS53126 allows the user to select from 2 different switching frequencies by connecting the TEST2 pin to either GND or V5FILT. Connect TEST2 to GND for a switching frequency (fsw) of 350KHz. Connect TEST2 to V5FILT for a switching frequency of 700KHz.

8.3.8 Output Discharge Control

The TPS53126 discharges the outputs when ENx is low, or when the controller is turned off by the protection functions (OVP, UVP, UVLO, and thermal shutdown). The device discharges an output using an internal 40-Ω MOSFET which is connected to VOx and PGNDx. The external low-side MOSFET is not turned on during the output discharge operation to avoid the possibility of causing negative voltage at the output. This discharge ensures that, on start, the regulated voltage always initializes from zero volts.

8.3.9 Overcurrent Limit

The TPS53126 has a cycle-by-cycle over current limit feature. The over current limits the inductor valley current by monitoring the voltage drop across the low-side MOSFET $R_{DS(on)}$ during the low-side driver on-time. If the inductor current is larger than the over current limit (OCL), the TPS53126 delays the start of the next switching cycle until the sensed inductor current falls below the OCL current. MOSFET $R_{DS(on)}$ current sensing is used to provide an accuracy and cost effective solution without external devices. To program the OCL, the TRIPx pin should be connected to GND through a trip voltage setting resistor, according to the following equations.

$$V_{trip} = \left(I_{OCL} - \frac{(V_{IN} - V_O)}{2 \times L1 \times f_{sw}} \times \frac{V_O}{V_{IN}} \right) \times R_{DS(on)} \quad (1)$$

$$R_{trip}(k\Omega) = \frac{V_{trip}(mV)}{I_{trip}(\mu A)} \quad (2)$$

Feature Description (continued)

The trip voltage should be between 30mV to 300mV over all operational temperature, including the 4000ppm/°C temperature slope compensation for the temperature dependency of the $R_{DS(on)}$. If the load current exceeds the over-current limit, the voltage will begin to drop. If the over-current conditions continues the output voltage will fall below the under voltage protection threshold and the TPS53126 will shut down.

8.3.10 Over/under Voltage Protection

The TPS53126 monitors the output voltage via the feedback voltage to detect over and under voltage. When the feedback voltage becomes higher than 115% of the reference voltage, the TPS53126 turns off the high-side MOSFET driver, turns on the low-side MOSFET driver and latches off.

When the feedback voltage becomes lower than 70% of the reference voltage, the TPS53126 begins an internal UVP delay counter. After 30 μ s, the TPS53126 turns off both top and bottom MOSFET drivers and latches off. The UVP function is enabled approximately 2.0ms after power-on to prevent detecting UVP during soft-start. Both OVP and UVP latch conditions are reset when V5FILT triggers UVLO or the ENx pin goes low.

8.3.11 UVLO Protection

The TPS53126 has under voltage lock out protection (UVLO) that monitors the voltage of V5FILT pin. When the V5FILT voltage is lower than UVLO threshold voltage, the device is shut off. During shut-off, VREG5 and all output drivers are OFF and output discharge is ON. The UVLO is non-latch protection.

8.3.12 Thermal Shutdown

The TPS53126 includes an over temperature protection shut-down feature. If the TPS53126 die temperature exceeds the OTP threshold (typically 150°C), both the high-side and low-side drivers are shut off, the output voltage discharge function is enabled and then the device is shut off until the die temperature drops. Thermal shutdown is a non-latch protection.

8.4 Device Functional Modes

The TPS53126 has two operating modes. The TPS53126 is in shut down mode when the EN1 and EN2 pins are low. When the EN1 and EN2 pins is pulled high, the TPS53126 enters the normal operating mode.

9 Application and Implementation

9.1 Application Information

9.2 350 kHz Operation Application

The schematic of Figure 14 shows a typical 350 kHz application schematic. The 350 kHz switching frequency is selected by connecting TEST2 to the GND pin. The input voltage is 4.5 V to 24 V and the output voltage is 1.8 V for VO1 and 1.05 V for VO2.

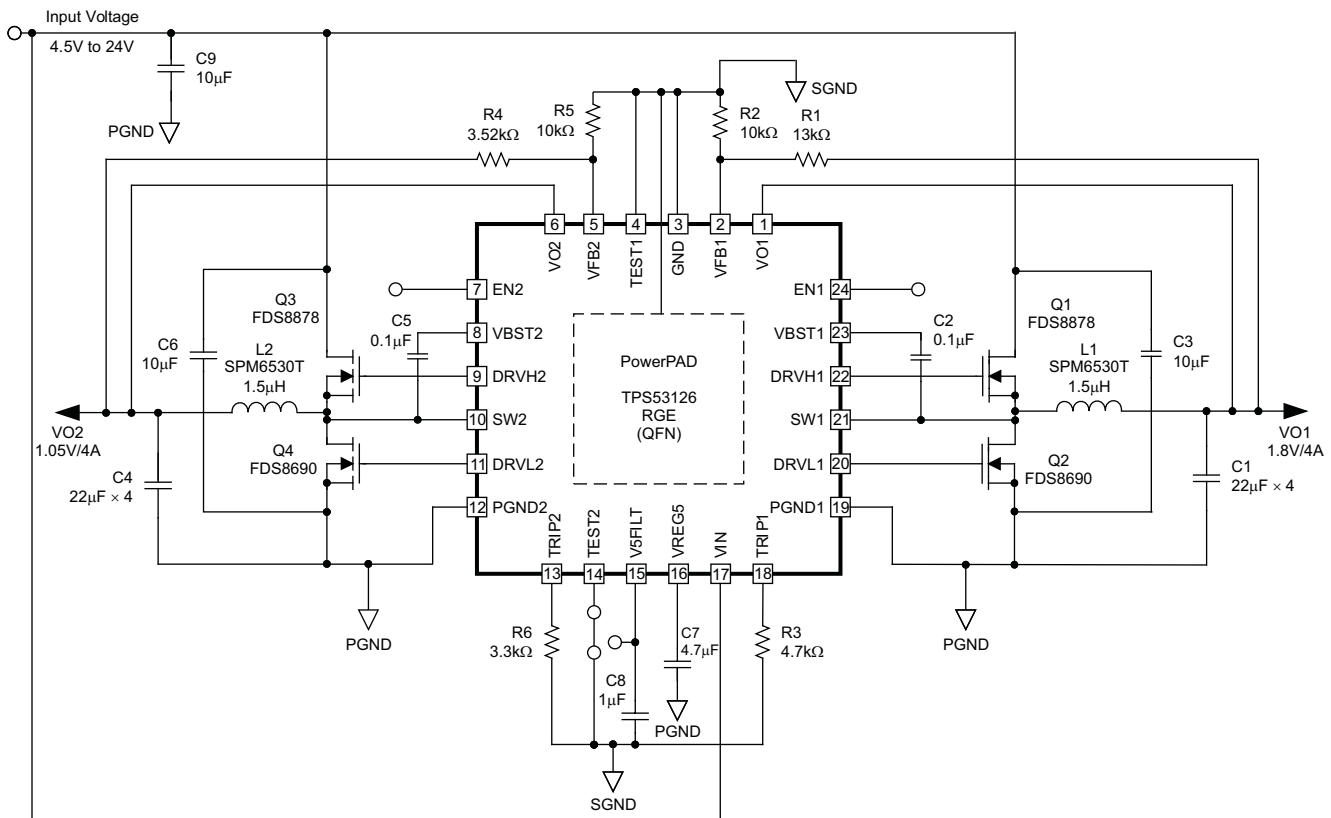

Figure 14. Typical Application Circuit at 350kHz Switching Frequency Selection (TEST2 Pin = GND)

9.2.1 Design Requirements

Table 1. Design Parameters

PARAMETERS	CHANNEL 1	CHANNEL 2
Input voltage	4.5 V to 24 V	4.5 V to 24 V
Output voltage	1.8 V	1.05 V
Output Current	4 A	4 A
Switching Frequency	350 kHz	350 kHz

9.2.2 Detailed Design Procedure

9.2.2.1 Choose Inductor

The inductance value is selected to provide approximately 30% peak to peak ripple current at maximum load. Larger ripple current increases output ripple voltage, improve S/N ratio and contribute to stable operation. Equation 3 can be used to calculate L1.

$$L1 = \frac{(V_{IN(max)} - V_{o1})}{I_{L1(ripple)} \times f_{sw}} \times \frac{V_{o1}}{V_{IN(max)}} = \frac{3 \times (V_{IN(max)} - V_{o1})}{I_{o1} \times f_{sw}} \times \frac{V_{o1}}{V_{IN(max)}} \quad (3)$$

The inductors current ratings needs to support both the RMS (thermal) current and the Peak (saturation) current. The RMS and peak inductor current can be estimated as follows:

$$I_{L1(ripple)} = \frac{V_{IN(max)} - V_{o1}}{L1 \times f_{sw}} \times \frac{V_{o1}}{V_{IN(max)}} \quad (4)$$

$$I_{L1(peak)} = \frac{V_{trip}}{R_{DS(on)}} + I_{L1(ripple)} \quad (5)$$

$$I_{L1(RMS)} = \sqrt{I_{o1}^2 + \frac{1}{12} (I_{L1(ripple)})^2} \quad (6)$$

Note: The calculation above shall serve as a general reference. To further improve transient response, the output inductance could be reduced further. This needs to be considered along with the selection of the output capacitor.

9.2.2.2 Choose Output Capacitor

The capacitor value and ESR determines the amount of output voltage ripple and load transient response. Recommend to use ceramic output capacitor.

$$C1 = \frac{\Delta I_{load}^2 \times L1}{2 \times V_{o1} \times \Delta V_{os}} \quad (7)$$

$$C1 = \frac{\Delta I_{load}^2 \times L1}{2 \times K \times \Delta V_{us}} \quad (8)$$

Where:

$$K = \left((V_{IN} - V_{o1}) - \frac{T_{min(off)}}{T_{on1}} \times V_{o1} \right) \times \frac{T_{on1}}{T_{on1} + T_{min(off)}} \quad (9)$$

$$C1 = \frac{I_{L1(ripple)}}{8 V_{o1(ripple)}} \times \frac{1}{f_{sw}} \quad (10)$$

Select the capacitance value greater than the largest value calculated from [Equation 7](#), [Equation 8](#) and [Equation 10](#). The capacitance for C1 should be greater than 66 μ F.

Where:

ΔV_{os} = the allowable amount of overshoot voltage in load transition

ΔV_{us} = the allowable amount of undershoot voltage in load transition

$T_{min(off)}$ = Min-off time

9.2.2.3 Choose Input Capacitor

The TPS53126 requires an input decoupling capacitor and a bulk capacitor is needed depending on the application. A minimum 10- μ F high-quality ceramic capacitor is recommended for the input capacitor. The capacitor voltage rating needs to be greater than the maximum input voltage.

9.2.2.4 Choose Bootstrap Capacitor

The TPS53126 requires a bootstrap capacitor from SWx to VBSTx to provide the floating supply for the high-side drivers. A minimum 0.1- μ F high-quality ceramic capacitor is recommended. The voltage rating should be greater than 6 V.

9.2.2.5 Choose VREG5 and V5FILT Capacitors

The TPS53126 requires both the VREG5 regulator and V5FILT input are bypassed. A minimum 4.7- μ F high-quality ceramic capacitor must be connected between the VREG5 and GND for proper operation. A minimum 1.0- μ F high-quality ceramic capacitor must be connected between the V5FILT and GND for proper operation. Both of these capacitors' voltage ratings should be greater than 6 V.

9.2.2.6 Choose Output Voltage Set Point Resistors

The output voltage is set with a resistor divider from output voltage node to the VFBx pin. It is recommended to use 1% tolerance or better resistors. Select R2 between 10 k Ω and 100 k Ω and use [Equation 11](#) and [Equation 12](#) to calculate R1.

$$R1 = \left(\frac{V_{o1}}{0.765 + \frac{V_{FB1(ripple)}}{2}} - 1 \right) \times R2 \quad (\text{TEST2=GND}) \quad (11)$$

$$R1 = \left(\frac{V_{o1}}{0.758 + \frac{V_{FB1(ripple)}}{2}} - 1 \right) \times R2 \quad (\text{TEST2 = V5FILT}) \quad (12)$$

Where:

$V_{FB1(ripple)}$ = Ripple Voltage at VFB1

9.2.2.7 Choose Over Current Limit Set Point Resistors

$$V_{trip} = \left(I_{OCL} - \frac{(V_{IN} - V_O)}{2 \times L1 \times f_{sw}} \times \frac{V_O}{V_{IN}} \right) \times R_{DS(on)} \quad (13)$$

$$R_{trip}(k\Omega) = \frac{V_{trip}(mV)}{I_{trip}(\mu A)} \quad (14)$$

Where:

$R_{DS(on)}$ = Low Side FET on-resistance

I_{trip} = TRIP pin source current (= 10 μ A)

I_{OCL} = Over current limit

9.2.3 350 kHz Application Curves

Application curves Figure 15, Figure 16, Figure 17, Figure 18, Figure 23 and Figure 24 apply to both the circuits of 350 kHz Operation Application and 700 KHz Operation Application.

IO1 = 3 A

Figure 15. SWITCHING FREQUENCY vs INPUT VOLTAGE (CH1)

IO2 = 3 A

VIN = 12 V

Figure 30. 1.05V EFFICIENCY vs OUTPUT CURRENT (CH2)

Figure 31. 1.05V OUTPUT RIPPLE VOLTAGE

10 Power Supply Recommendations

The TPS53126 is designed to operate from an input voltage supply range between 4.5 V and 24 V. This input supply must be well regulated. If the input supply is located more than a few inches from the TPS53126 device additional 0.1 μ F ceramic capacitance may be required in addition to the ceramic bypass capacitors, 10 μ F.

11 Layout

11.1 Layout Guidelines

- Keep the input switching current loop as small as possible. (VIN \geq C3 \geq PNGD \geq Sync FET \geq SW \geq Control FET)
- Place the input capacitor (C3) close to the top switching FET. The output current loop should also be kept as small as possible.
- Keep the SW node as physically small and short as possible as to minimize parasitic capacitance and inductance and to minimize radiated emissions. Kelvin connections should be brought from the output to the feedback terminal (FBx) of the device.
- Keep analog and non-switching components away from switching components.
- Make a single point connection from the signal ground to power ground.(1)
- Do not allow switching current to flow under the device.
- DRVH and DRVL line should not run close to SW node or minimize it. (2)
- GND terminals for capacitors of SSx and V5FILT and resistors of feedback and TRIPx should be connected to SGND. (3)
- GND terminals for capacitors of VREG5 and VIN should be connected to PGND. (4)
- Signal lines should not run under/near Output Inductor or minimize it. (5)

11.2 Layout Example

The layout example of [Figure 32](#) corresponds to the schematic of [Figure 14](#).

12 Device and Documentation Support

12.1 Trademarks

D-CAP2 is a trademark of Texas Instruments.

12.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS53126PW	ACTIVE	TSSOP	PW	24	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 85	PS53126	Samples
TPS53126PWR	ACTIVE	TSSOP	PW	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 85	PS53126	Samples
TPS53126RGER	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 53126	Samples
TPS53126RGET	ACTIVE	VQFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 53126	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

 - F. Falls within JEDEC MO-220.

THERMAL PAD MECHANICAL DATA

RGE (S-PVQFN-N24)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206344-3/AH 08/14

NOTES: A. All linear dimensions are in millimeters

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
