

# 1-A, WIDE INPUT RANGE, STEP-DOWN CONVERTER

Check for Samples: [TPS5410](#)

## FEATURES

- **Wide Input Voltage Range: 5.5 V to 36 V**
- **Up to 1-A Continuous (1.2-A Peak) Output Current**
- **High Efficiency up to 95% Enabled by 110-mΩ Integrated MOSFET Switch**
- **Wide Output Voltage Range: Adjustable Down to 1.22 V with 1.5% Initial Accuracy**
- **Internal Compensation Minimizes External Parts Count**
- **Fixed 500-kHz Switching Frequency for Small Filter Size**
- **Improved Line Regulation and Transient Response by Input Voltage Feed Forward**
- **System Protected by Over Current Limiting, Over Voltage Protection and Thermal Shutdown**
- **–40°C to 125°C Operating Junction Temperature Range**
- **Available in Small 8-Pin SOIC Package**

## APPLICATIONS

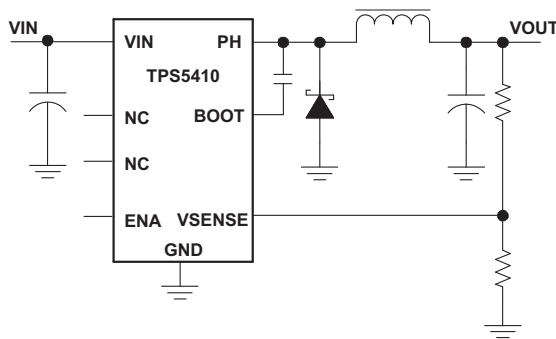

- **Consumer: Set-top Box, DVD, LCD Displays**
- **Industrial and Car Audio Power Supplies**
- **Battery Chargers, High Power LED Supply**
- **12-V/24-V Distributed Power Systems**

## DESCRIPTION

The TPS5410 is a high-output-current PWM converter that integrates a low resistance high side N-channel MOSFET. Included on the substrate with the listed features is a high performance voltage error amplifier that provides tight voltage regulation accuracy under transient conditions; an undervoltage-lockout circuit to prevent start-up until the input voltage reaches 5.5 V; an internally set slow-start circuit to limit inrush currents; and a voltage feed-forward circuit to improve the transient response. Using the ENA pin, shutdown supply current is reduced to 18  $\mu$ A typically. Other features include an active high enable, overcurrent limiting, overvoltage protection and thermal shutdown. To reduce design complexity and external component count, the TPS5410 feedback loop is internally compensated.

The TPS5410 device is available in an easy to use 8-pin SOIC package. TI provides evaluation modules and software tools to aid in quickly achieving high-performance power supply designs to meet aggressive equipment development cycles.

Simplified Schematic

Efficiency vs Output Current

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### ORDERING INFORMATION

T <sub>J</sub>	INPUT VOLTAGE	OUTPUT VOLTAGE	PACKAGE <sup>(1)</sup>	PART NUMBER
–40°C to 125°C	5.5 V to 36 V	Adjustable to 1.22 V	SOIC (D) <sup>(2)</sup>	TPS5410D

- (1) For the most current package and ordering information, see the *Package Option Addendum* at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).
- (2) The D package is also available taped and reeled. Add an R suffix to the device type (i.e., TPS5410DR).

### ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup> <sup>(2)</sup>

		VALUE	UNIT	
V <sub>I</sub>	Input voltage range	VIN	–0.3 to 40 <sup>(3)</sup>	
		BOOT	–0.3 to 50	
		PH (steady-state)	–0.6 to 40 <sup>(3)</sup>	
		EN	–0.3 to 7	
		VSENSE	–0.3 to 3	
		BOOT-PH	10	
		PH (transient < 10 ns)	–1.2	
I <sub>O</sub>	Source current	PH	Internally Limited	
I <sub>lkg</sub>	Leakage current	PH	10	μA
T <sub>J</sub>	Operating virtual junction temperature range		–40 to 150	°C
T <sub>stg</sub>	Storage temperature		–65 to 150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.
- (3) Approaching the absolute maximum rating for the VIN pin may cause the voltage on the PH pin to exceed the absolute maximum rating.

### THERMAL INFORMATION

THERMAL METRIC <sup>(1)(2)(3)</sup>		TPS5410	UNITS
		D (8 PINS)	
θ <sub>JA</sub>	Junction-to-ambient thermal resistance (custom board) <sup>(4)</sup>	75	°C/W
θ <sub>JA</sub>	Junction-to-ambient thermal resistance (standard board)	105.9	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	5.7	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	47.0	
θ <sub>JC(top)</sub>	Junction-to-case(top) thermal resistance	45.0	
θ <sub>JC(bottom)</sub>	Junction-to-case(bottom) thermal resistance	n/a	
θ <sub>JB</sub>	Junction-to-board thermal resistance	47.8	

- (1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, [SPRA953](http://www.ti.com/lit/zip/S194).
- (2) Maximum power dissipation may be limited by overcurrent protection
- (3) Power rating at a specific ambient temperature T<sub>A</sub> should be determined with a junction temperature of 125°C. This is the point where distortion starts to substantially increase. Thermal management of the final PCB should strive to keep the junction temperature at or below 125°C for best performance and long-term reliability. See *Thermal Calculations* in applications section of this data sheet for more information.
- (4) Test boards conditions:
  - (a) 3 in x 3 in, 2 layers, thickness: 0.062 inch.
  - (b) 2 oz. copper traces located on the top and bottom of the PCB.

**RECOMMENDED OPERATING CONDITIONS**

		MIN	NOM	MAX	UNIT
$V_I$	Input voltage range, VIN	5.5		36	V
$T_J$	Operating junction temperature	-40		125	°C

**ELECTRICAL CHARACTERISTICS**
 $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ , VIN = 5.5 V to 36 V (unless otherwise noted)

**PIN ASSIGNMENTS**

**TERMINAL FUNCTIONS**

TERMINAL		DESCRIPTION
NAME	NO.	
BOOT	1	Boost capacitor for the high-side FET gate driver. Connect 0.01 $\mu$ F low ESR capacitor from BOOT pin to PH pin.
NC	2, 3	Not connected internally.
VSENSE	4	Feedback voltage for the regulator. Connect to output voltage divider.
ENA	5	On/off control. Below 0.5 V, the device stops switching. Float the pin to enable.
GND	6	Ground.
VIN	7	Input supply voltage. Bypass VIN pin to GND pin close to device package with a high quality, low ESR ceramic capacitor.
PH	8	Source of the high side power MOSFET. Connected to external inductor and diode.

APPLICATION INFORMATION

FUNCTIONAL BLOCK DIAGRAM

DETAILED DESCRIPTION

Oscillator Frequency

The internal free running oscillator sets the PWM switching frequency at 500 kHz. The 500 kHz switching frequency allows less output inductance for the same output ripple requirement resulting in a smaller output inductor.

Voltage Reference

The voltage reference system produces a precision reference signal by scaling the output of a temperature stable bandgap circuit. The bandgap and scaling circuits are trimmed during production testing to an output of 1.221 V at room temperature.

Enable (ENA) and Internal Slow Start

The ENA pin provides electrical on/off control of the regulator. Once the ENA pin voltage exceeds the threshold voltage, the regulator starts operation and the internal slow start begins to ramp. If the ENA pin voltage is pulled below the threshold voltage, the regulator stops switching and the internal slow start resets. Connecting the pin to ground or to any voltage less than 0.5 V disables the regulator and activate the shutdown mode. The quiescent current of the TPS5410 in shutdown mode is typically 18 µA.

The ENA pin has an internal pullup current source, allowing the user to float the ENA pin. If an application requires controlling the ENA pin, use open drain or open collector output logic to interface with the pin. To limit the start-up inrush current, an internal slow start circuit is used to ramp up the reference voltage from 0 V to its final value linearly. The internal slow start time is 8 ms typically.

### Undervoltage Lockout (UVLO)

The TPS5410 incorporates an undervoltage lockout circuit to keep the device disabled when VIN (the input voltage) is below the UVLO start voltage threshold. During power up, internal circuits are held inactive and the internal slow start is grounded until VIN exceeds the UVLO start threshold voltage. Once the UVLO start threshold voltage is reached, the internal slow start is released and device start-up begins. The device operates until VIN falls below the UVLO stop threshold voltage. The typical hysteresis in the UVLO comparator is 330 mV.

### Boost Capacitor (BOOT)

Connect a 0.01 μF low-ESR ceramic capacitor between the BOOT pin and PH pin. This capacitor provides the gate drive voltage for the high-side MOSFET. X7R or X5R grade dielectrics are recommended due to their stable values over temperature.

### Output Feedback (VSENSE)

The output voltage of the regulator is set by feeding back the center point voltage of an external resistor divider network to the VSENSE pin. In steady-state operation, the VSENSE pin voltage should be equal to the voltage reference 1.221 V.

### Internal Compensation

The TPS5410 implements internal compensation to simplify the regulator design. Since the TPS5410 uses voltage mode control, a type 3 compensation network has been designed on chip to provide a high crossover frequency and a high phase margin for good stability. See the *Internal Compensation Network* in the applications section for more details.

### Voltage Feed Forward

The internal voltage feed forward provides a constant DC power stage gain despite any variations with the input voltage. This greatly simplifies the stability analysis and improves the transient response. Voltage feed forward varies the peak ramp voltage inversely with the input voltage so that the modulator and power stage gain are constant at the feed forward gain, i.e.

$$\text{Feed Forward Gain} = \frac{V_{IN}}{\text{Ramp}_{\text{pk-pk}}} \quad (1)$$

The typical feed forward gain of TPS5410 is 25.

### Pulse-Width-Modulation (PWM) Control

The regulator employs a fixed frequency pulse-width-modulator (PWM) control method. First, the feedback voltage (VSENSE pin voltage) is compared to the constant voltage reference by the high gain error amplifier and compensation network to produce a error voltage. Then, the error voltage is compared to the ramp voltage by the PWM comparator. In this way, the error voltage magnitude is converted to a pulse width which is the duty cycle. Finally, the PWM output is fed into the gate drive circuit to control the on-time of the high-side MOSFET.

### Overcurrent Limiting

Overcurrent limiting is implemented by sensing the drain-to-source voltage across the high-side MOSFET. The drain to source voltage is then compared to a voltage level representing the overcurrent threshold limit. If the drain-to-source voltage exceeds the overcurrent threshold limit, the overcurrent indicator is set true. The system will ignore the overcurrent indicator for the leading edge blanking time at the beginning of each cycle to avoid any turn-on noise glitches.

Once overcurrent indicator is set true, overcurrent limiting is triggered. The high-side MOSFET is turned off for the rest of the cycle after a propagation delay. The overcurrent limiting scheme is called cycle-by-cycle current limiting.

Sometimes under serious overload conditions such as short-circuit, the overcurrent runaway may still happen when using cycle-by-cycle current limiting. A second mode of current limiting is used, i.e. hiccup mode overcurrent limiting. During hiccup mode overcurrent limiting, the voltage reference is grounded and the high-side MOSFET is turned off for the hiccup time. Once the hiccup time duration is complete, the regulator restarts under control of the slow start circuit.

## Overvoltage Protection

The TPS5410 has an overvoltage protection (OVP) circuit to minimize voltage overshoot when recovering from output fault conditions. The OVP circuit includes an overvoltage comparator to compare the VSENSE pin voltage and a threshold of  $112.5\% \times V_{REF}$ . Once the VSENSE pin voltage is higher than the threshold, the high-side MOSFET will be forced off. When the VSENSE pin voltage drops lower than the threshold, the high-side MOSFET will be enabled again.

## Thermal Shutdown

The TPS5410 protects itself from overheating with an internal thermal shutdown circuit. If the junction temperature exceeds the thermal shutdown trip point, the voltage reference is grounded and the high-side MOSFET is turned off. The part is restarted under control of the slow start circuit automatically when the junction temperature drops  $14^{\circ}\text{C}$  below the thermal shutdown trip point.

## PCB Layout

Connect a low ESR ceramic bypass capacitor to the VIN pin. Care should be taken to minimize the loop area formed by the bypass capacitor connections, the VIN pin, and the TPS5410 ground pin. The best way to do this is to extend the top side ground area from under the device adjacent to the VIN trace, and place the bypass capacitor as close as possible to the VIN pin. The minimum recommended bypass capacitance is  $4.7\mu\text{F}$  ceramic with a X5R or X7R dielectric.

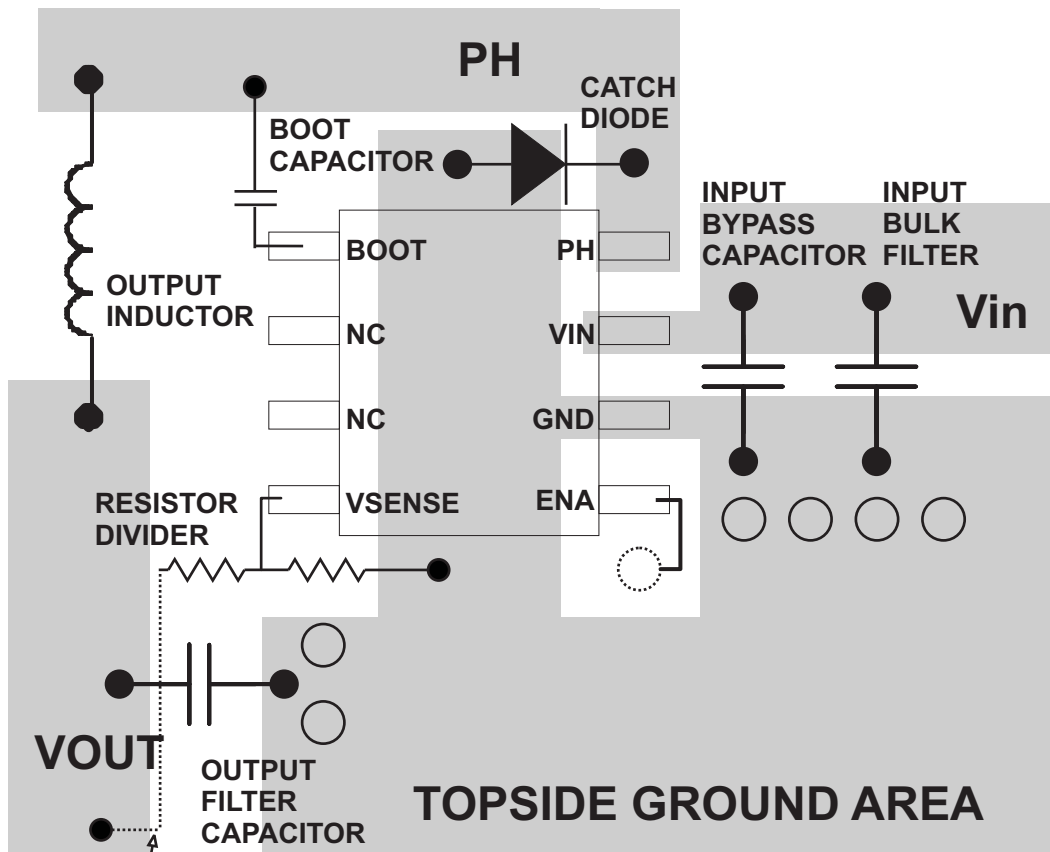

There should be a ground area on the top layer directly underneath the IC to connect the GND pin of the device and the anode of the catch diode. The GND pin should be tied to the PCB ground by connecting it to the ground area under the device as shown in [Figure 9](#).

The PH pin should be routed to the output inductor, catch diode and boot capacitor. Since the PH connection is the switching node, the inductor should be located close to the PH pin, and the area of the PCB conductor minimized to prevent excessive capacitive coupling. The catch diode should also be placed close to the device to minimize the output current loop area. Connect the boot capacitor between the phase node and the BOOT pin as shown. Keep the boot capacitor close to the IC and minimize the conductor trace lengths. The component placements and connections shown work well, but other connection routings may also be effective.

Connect the output filter capacitor(s) as shown between the VOUT trace and GND. It is important to keep the loop formed by the PH pin, Lout, Cout and GND as small as is practical.

Connect the VOUT trace to the VSENSE pin using the resistor divider network to set the output voltage. Do not route this trace too close to the PH trace. Due to the size of the IC package and the device pinout, the trace may need to be routed under the output capacitor. The routing may be done on an alternate layer if a trace under the output capacitor is not desired.

If the grounding scheme shown is used via a connection to a different layer to route to the ENA pin.

Route feedback trace under the output filter capacitor or on the other layer.

### Application Circuits

Figure 11 shows the schematic for a typical TPS5410 application. The TPS5410 can provide up to 1-A output current at a nominal output voltage of 12 V.

A. C3 = Tantalum AVX TPSE476M020R0150

Figure 11. Application Circuit, 14.5-V — 36 V to 12-V

## Design Procedure

The following design procedure can be used to select component values for the TPS5410. Alternately, see the TI Web site at [www.ti.com](http://www.ti.com) for any available software tools to aid in the design process. This section presents a simplified discussion of the design process.

To begin the design process, a few parameters must be determined. The designer must know the following:

- Input voltage range
- Output voltage
- Input ripple voltage
- Output ripple voltage
- Output current rating
- Operating frequency

## Design Parameters

For this design example, use the following as the input parameters:

DESIGN PARAMETER <sup>(1)</sup>	EXAMPLE VALUE
Input voltage range	14.5 V to 36 V
Output voltage	12 V
Input ripple voltage	300 mV
Output ripple voltage	50 mV
Output current rating	1 A
Operating frequency	500 kHz

(1) As an additional constraint, the design is set up to be small size and low component height.

## Switching Frequency

The switching frequency for the TPS5410 is internally set to 500 kHz. It is not possible to adjust the switching frequency.

## Input Capacitors

The TPS5410 requires an input decoupling capacitor and, depending on the application, a bulk input capacitor. The minimum recommended value for the decoupling capacitor is 4.7  $\mu$ F. A high quality ceramic type X5R or X7R is required. For some applications, a smaller value decoupling capacitor may be used, if the input voltage and current ripple ratings are not exceeded. The voltage rating must be greater than the maximum input voltage, including ripple. For this design, a 4.7  $\mu$ F capacitor, C1 issued to allow for smaller 1812 case size to be used while maintaining a 50 V rating.

This input ripple voltage can be approximated by [Equation 2](#) :

$$\Delta V_{IN} = \frac{I_{OUT(MAX)} \times 0.25}{C_{BULK} \times f_{SW}} + (I_{OUT(MAX)} \times ESR_{MAX}) \quad (2)$$

Where  $I_{OUT(MAX)}$  is the maximum load current,  $f_{SW}$  is the switching frequency,  $C_1$  is the input capacitor value and  $ESR_{MAX}$  is the maximum series resistance of the input capacitor.

The maximum RMS ripple current also needs to be checked. For worst case conditions, this is approximated by [Equation 3](#):

$$I_{CIN} = \frac{I_{OUT(MAX)}}{2} \quad (3)$$

In this example, the calculated input ripple voltage is 137 mV, and the RMS ripple current is 0.5 A. The maximum voltage across the input capacitors would be  $V_{IN\ max}$  plus  $\Delta V_{IN}/2$ . The chosen input decoupling capacitors are rated for 50 V, and the ripple current capacity for each is 3 A at 500 kHz, providing ample margin. The actual measured input ripple voltage may be larger than the calculated value due to the output impedance of the input voltage source, decrease in actual capacitance due to bias voltage and parasitics associated with the layout.

**CAUTION**

The maximum ratings for voltage and current are not to be exceeded under any circumstance.

Additionally, some bulk capacitance may be needed, especially if the TPS5410 circuit is not located within approximately 2 inches from the input voltage source. The value for this capacitor is not critical but it should be rated to handle the maximum input voltage including ripple voltage and should filter the output so that input ripple voltage is acceptable.

**Output Filter Components**

Two components need to be selected for the output filter, L1 and C3. Since the TPS5410 is an internally compensated device, a limited range of filter component types and values can be supported.

**Inductor Selection**

To calculate the minimum value of the output inductor, use [Equation 4](#):

$$L_{\text{MIN}} = \frac{V_{\text{OUT}} \times (V_{\text{IN(MAX)}} - V_{\text{OUT}})}{V_{\text{IN(max)}} \times K_{\text{IND}} \times I_{\text{OUT}} \times F_{\text{SW}} \times 0.8} \quad (4)$$

$K_{\text{IND}}$  is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. Three things need to be considered when determining the amount of ripple current in the inductor: the peak to peak ripple current affects the output ripple voltage amplitude, the ripple current affects the peak switch current, and the amount of ripple current determines at what point the circuit becomes discontinuous. For designs using the TPS5410,  $K_{\text{IND}}$  of 0.2 to 0.3 yields good results. Low output ripple voltages is obtained when paired with the proper output capacitor, the peak switch current is below the current limit set point, and low load currents can be sourced before discontinuous operation.

For this design example, use  $K_{\text{IND}} = 0.3$ , and the minimum inductor value is 66  $\mu\text{H}$ . The next highest standard value used in this design is 68  $\mu\text{H}$ .

For the output filter inductor, it is important that the RMS current and saturation current ratings not be exceeded. The RMS inductor current can be found from [Equation 5](#):

$$I_{\text{L(RMS)}} = \sqrt{I_{\text{OUT(MAX)}}^2 + \frac{1}{12} \times \left( \frac{V_{\text{OUT}} \times (V_{\text{IN(MAX)}} - V_{\text{OUT}})}{V_{\text{IN(MAX)}} \times L_{\text{OUT}} \times F_{\text{SW}} \times 0.8} \right)^2} \quad (5)$$

and the peak inductor current can be determined using [Equation 6](#):

$$I_{\text{L(PK)}} = I_{\text{OUT(MAX)}} + \frac{V_{\text{OUT}} \times (V_{\text{IN(MAX)}} - V_{\text{OUT}})}{1.6 \times V_{\text{IN(MAX)}} \times L_{\text{OUT}} \times F_{\text{SW}}} \quad (6)$$

For this design, the RMS inductor current is 1.004 A, and the peak inductor current is 1.147 A. The chosen inductor is a Coilcraft MSS1260-683 type. The nominal inductance is 68 $\mu\text{H}$ . It has a saturation current rating of 2.3 A and a RMS current rating of 2.3 A, which meets the requirements. Inductor values for use with the TPS5410 are in the range of 10  $\mu\text{H}$  to 100  $\mu\text{H}$ .

**Capacitor Selection**

The important design factors for the output capacitor are dc voltage rating, ripple current rating, and equivalent series resistance (ESR). The dc voltage and ripple current ratings cannot be exceeded. The ESR is important because along with the inductor ripple current it determines the amount of output ripple voltage. The actual value of the output capacitor is not critical, but some practical limits do exist. Consider the relationship between the desired closed loop crossover frequency of the design and LC corner frequency of the output filter. Due to the

design of the internal compensation, it is recommended to keep the closed loop crossover frequency in the range 3 kHz to 30 kHz as this frequency range has adequate phase boost to allow for stable operation. For this design example, the intended closed loop crossover frequency is between 2590 Hz and 24 kHz, and below the ESR zero of the output capacitor. Under these conditions, the closed loop crossover frequency is related to the LC corner frequency as:

$$f_{CO} = \frac{f_{LC}^2}{85 V_{OUT}} \quad (7)$$

and the desired output capacitor value for the output filter to:

$$C_{OUT} = \frac{1}{3357 \times L_{OUT} \times f_{CO} \times V_{OUT}} \quad (8)$$

For a desired crossover of 10 kHz and a 68-μH inductor, the calculated value for the output capacitor is 36.5 μF. The capacitor type should be chosen so that the ESR zero is above the loop crossover. The maximum ESR is:

$$ESR_{MAX} = \frac{1}{2\pi \times C_{OUT} \times f_{CO}} \quad (9)$$

The maximum ESR of the output capacitor also determines the amount of output ripple as specified in the initial design parameters. The output ripple voltage is the inductor ripple current times the ESR of the output filter. Check that the maximum specified ESR as listed in the capacitor data sheet results in an acceptable output ripple voltage:

$$V_{PP(MAX)} = \frac{ESR_{MAX} \times V_{OUT} \times (V_{IN(MAX)} - V_{OUT})}{N_C \times V_{IN(MAX)} \times L_{OUT} \times F_{SW} \times 0.8} \quad (10)$$

Where:

$\Delta V_{PP}$  is the desired peak-to-peak output ripple.

$N_C$  is the number of parallel output capacitors.

$F_{SW}$  is the switching frequency.

The minimum ESR of the output capacitor should also be considered. For a good phase margin, if the ESR is zero when the ESR is at its minimum, it should not be above the internal compensation poles at 24 kHz and 54 kHz.

The selected output capacitor must also be rated for a voltage greater than the desired output voltage plus one half the ripple voltage. Any derating amount must also be included. The maximum RMS ripple current in the output capacitor is given by [Equation 11](#):

$$I_{COUT(RMS)} = \frac{1}{\sqrt{12}} \times \left[ \frac{V_{OUT} \times (V_{IN(MAX)} - V_{OUT})}{V_{IN(MAX)} \times L_{OUT} - F_{SW} \times 0.8 \times N_C} \right] \quad (11)$$

Where:

$N_C$  is the number of output capacitors in parallel.

$F_{SW}$  is the switching frequency.

For this design example, a single 47-μF output capacitor is chosen for C3. This value is close to the calculated value of 36.5 μF and yields an actual closed loop cross over frequency of 10.05 kHz. The calculated RMS ripple current is 84.9 mA and the maximum ESR required is 339 mΩ. A capacitor that meets these requirements is a AVX TPSE476M020R0150, rated at 20 V with a maximum ESR of 150 mΩ and a ripple current rating of 1.369 A. This capacitor results in a peak-to-peak output ripple of 44 mV using equation 10. An additional small 0.1-μF ceramic bypass capacitor may also be used, but is not included in this design.

Other capacitor types can be used with the TPS5410, depending on the needs of the application.

**Output Voltage Setpoint**

The output voltage of the TPS5410 is set by a resistor divider (R1 and R2) from the output to the VSENSE pin. Calculate the R2 resistor value for the output voltage of 12 V using Equation 12:

$$R2 = \frac{R1 \times 1.221}{V_{OUT} - 1.221} \tag{12}$$

For any TPS5410 design, start with an R1 value of 10 kΩ. R2 is then 1.13 kΩ.

**Boot Capacitor**

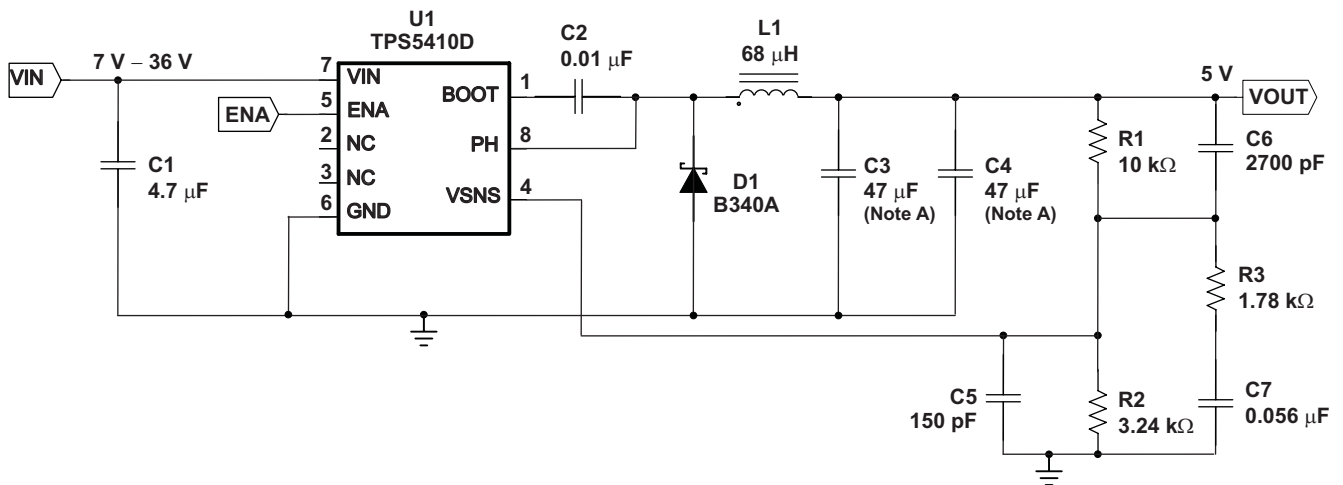

The boot capacitor should be 0.01 μF.

**Catch Diode**

The TPS5410 is designed to operate using an external catch diode between PH and GND. The selected diode must meet the absolute maximum ratings for the application: Reverse voltage must be higher than the maximum voltage at the PH pin, which is VINMAX + 0.5 V. Peak current must be greater than IOUTMAX plus on half the peak-to-peak inductor current. Forward voltage drop should be small for higher efficiencies. It is important to note that the catch diode conduction time is typically longer than the high-side FET on time; therefore, the diode parameters improve the overall efficiency. Additionally, check that the device chosen is capable of dissipating the power losses. For this design, a Diodes, Inc. B340A is chosen, with a reverse voltage of 40 V, forward current of 3 A, and a forward voltage drop of 0.5 V.

**Additional Circuits**

Figure 12 shows an application circuit using all ceramic capacitors for the input and output filters. The design procedure is similar to those given for the design example, except for the selection of the output filter capacitor values and the design of the additional compensation components required to stabilize the circuit.

A. C3, C4 = Ceramic TDKC4532X5R1A476MT

**Figure 12. 7-V — 36-V Input to 5-V Output Application Circuit with Ceramic Capacitors**

**Output Filter Capacitor Selection**

When using ceramic output filter capacitors, the recommended LC resonant frequency should be no more than 7 kHz. Since the output inductor is already selected at 68 μH, this limits the minimum output capacitor value to:

$$C_O \text{ (MIN)} \geq \frac{1}{(2\pi \times 7000)^2 \times L_O} \tag{13}$$

The minimum capacitor value is calculated to be 7.6  $\mu\text{F}$ . For this circuit a larger value of capacitor will yield better transient response. Two output capacitors are used for C3 and C4 with a value of 47  $\mu\text{F}$  each. It is important to note that the actual capacitance of ceramic capacitors decreases with applied voltage. In this case the effective value used for the calculations is approximately 70 % of the rated value or 70  $\mu\text{F}$ .

### External Compensation Network

When using ceramic output capacitors, additional circuitry is required to stabilize the closed loop system. For this circuit the external components are R3, C5, C6 and C7. To determine the value of these components, first calculate the LC resonant frequency of the output filter:

$$F_{LC} = \frac{1}{2\pi \sqrt{L_O \times C_O \text{ (EFF)}}} \quad (14)$$

For this example the effective resonant frequency is calculated as 2306 Hz

The network composed of R1, R2, R3, C5, C6 and C7 has two poles and two zeros that are used to tailor the overall response of the feedback network to accommodate the use of the ceramic output capacitors. The pole and zero locations are given by the following equations:

$$F_{p1} = 500000 \times \frac{V_O}{F_{LC}} \quad (15)$$

$$F_{z1} = 0.7 \times F_{LC} \quad (16)$$

$$F_{z2} = 2.5 \times F_{LC} \quad (17)$$

The final pole is located at a frequency too high to be of concern. The values for R1 and R2 are fixed by the 5-V output voltage as calculated using [Equation 12](#). Now the values of R3, C5, C6 and C7 are determined using [Equation 18](#), [Equation 19](#), and [Equation 20](#):

$$C7 = \frac{1}{2\pi \times F_{p1} \times (R1 \parallel R2)} \quad (18)$$

$$R3 = \frac{1}{2\pi \times F_{z1} \times C7} \quad (19)$$

$$C6 = \frac{1}{2\pi \times F_{z2} \times R1} \quad (20)$$

For this design, using the closest standard values, C7 is 0.056  $\mu\text{F}$ , R3 is 1.76 k $\Omega$  and C6 is 2700 pF. C5 is added to improve load regulation performance. It is effectively in parallel with C6 in the location of the second pole frequency, so it should be small in relationship to C6. C5 should be less the 1/10 the value of C6. For this example, 150 pF works well.

For additional information on external compensation of the TPS5410 or other wide voltage range devices, see [SLVA237 Using TPS5410/20/30/31 With Aluminum/Ceramic Output Capacitors](#).

## ADVANCED INFORMATION

### Output Voltage Limitations

Due to the internal design of the TPS5410, there are both upper and lower output voltage limits for any given input voltage. The upper limit of the output voltage set point is constrained by the maximum duty cycle of 87% and is given by:

$$V_{OUTMAX} = 0.87 \times \left( (V_{INMIN} - I_{OMAX} \times 0.230) + V_D \right) - (I_{OMAX} \times R_L) - V_D \quad (21)$$

Where:

- $V_{INMIN}$  = minimum input voltage
- $I_{OMAX}$  = maximum load current
- $V_D$  = catch diode forward voltage.
- $R_L$  = output inductor series resistance.

This equation assumes maximum on resistance for the internal high side FET.

The lower limit is constrained by the minimum controllable on time which may be as high as 200 ns. The approximate minimum output voltage for a given input voltage and minimum load current is given by:

$$V_{OUTMIN} = 0.12 \times \left( (V_{INMAX} - I_{OMIN} \times 0.110) + V_D \right) - (I_{OMIN} \times R_L) - V_D \quad (22)$$

Where:

- $V_{INMAX}$  = maximum input voltage
- $I_{OMIN}$  = minimum load current
- $V_D$  = catch diode forward voltage.
- $R_L$  = output inductor series resistance.

This equation assumes nominal on resistance for the high side FET and accounts for worst case variation of operating frequency set point. Any design operating near the operational limits of the device should be checked to assure proper functionality.

### Internal Compensation Network

The design equations given in the example circuit can be used to generate circuits using the TPS5410. These designs are based on certain assumptions, and always select output capacitors within a limited range of ESR values. If a different capacitor type is desired, it may be possible to fit one to the internal compensation of the TPS5410. [Equation 23](#) gives the nominal frequency response of the internal voltage-mode type III compensation network:

$$H(s) = \frac{\left(1 + \frac{s}{2\pi \times Fz1}\right) \times \left(1 + \frac{s}{2\pi \times Fz2}\right)}{\left(\frac{s}{2\pi \times Fp0}\right) \times \left(1 + \frac{s}{2\pi \times Fp1}\right) \times \left(1 + \frac{s}{2\pi \times Fp2}\right) \times \left(1 + \frac{s}{2\pi \times Fp3}\right)} \quad (23)$$

Where

- Fp0 = 2165 Hz, Fz1 = 2170 Hz, Fz2 = 2590 Hz
- Fp1 = 24 kHz, Fp2 = 54 kHz, Fp3 = 440 kHz
- Fp3 represents the non-ideal parasitics effect.

Using this information along with the desired output voltage, feed forward gain and output filter characteristics, the closed loop transfer function can be derived.

**Thermal Calculations**

The following formulas show how to estimate the device power dissipation under continuous conduction mode operations. They should not be used if the device is working at light loads in the discontinuous conduction mode.

**Conduction Loss:**  $P_{con} = I_{OUT}^2 \times R_{ds(on)} \times V_{OUT} / V_{IN}$

**Switching Loss:**  $P_{sw} = V_{IN} \times I_{OUT} \times 0.01$

**Quiescent Current Loss:**  $P_q = V_{IN} \times 0.01$

**Total Loss:**  $P_{tot} = P_{con} + P_{sw} + P_q$

**Given  $T_A \Rightarrow$  Estimated Junction Temperature:**  $T_J = T_A + R_{th} \times P_{tot}$

**Given  $T_{JMAX} = 125^\circ\text{C} \Rightarrow$  Estimated Maximum Ambient Temperature:**  $T_{AMAX} = T_{JMAX} - R_{th} \times P_{tot}$

**PERFORMANCE GRAPHS**

The performance graphs in Figure 13 - Figure 20 are applicable to the circuit in Figure 11.  $T_A = 25^\circ\text{C}$ . unless otherwise specified.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
