

## Current Mode PWM Controller

### FEATURES

- Optimized for Off-line and DC to DC Converters
- Low Start Up Current (<0.5mA)
- Trimmed Oscillator Discharge Current
- Automatic Feed Forward Compensation
- Pulse-by-Pulse Current Limiting
- Enhanced Load Response Characteristics
- Under-Voltage Lockout With Hysteresis
- Double Pulse Suppression
- High Current Totem Pole Output
- Internally Trimmed Bandgap Reference
- 500kHz Operation
- Low Ro Error Amp

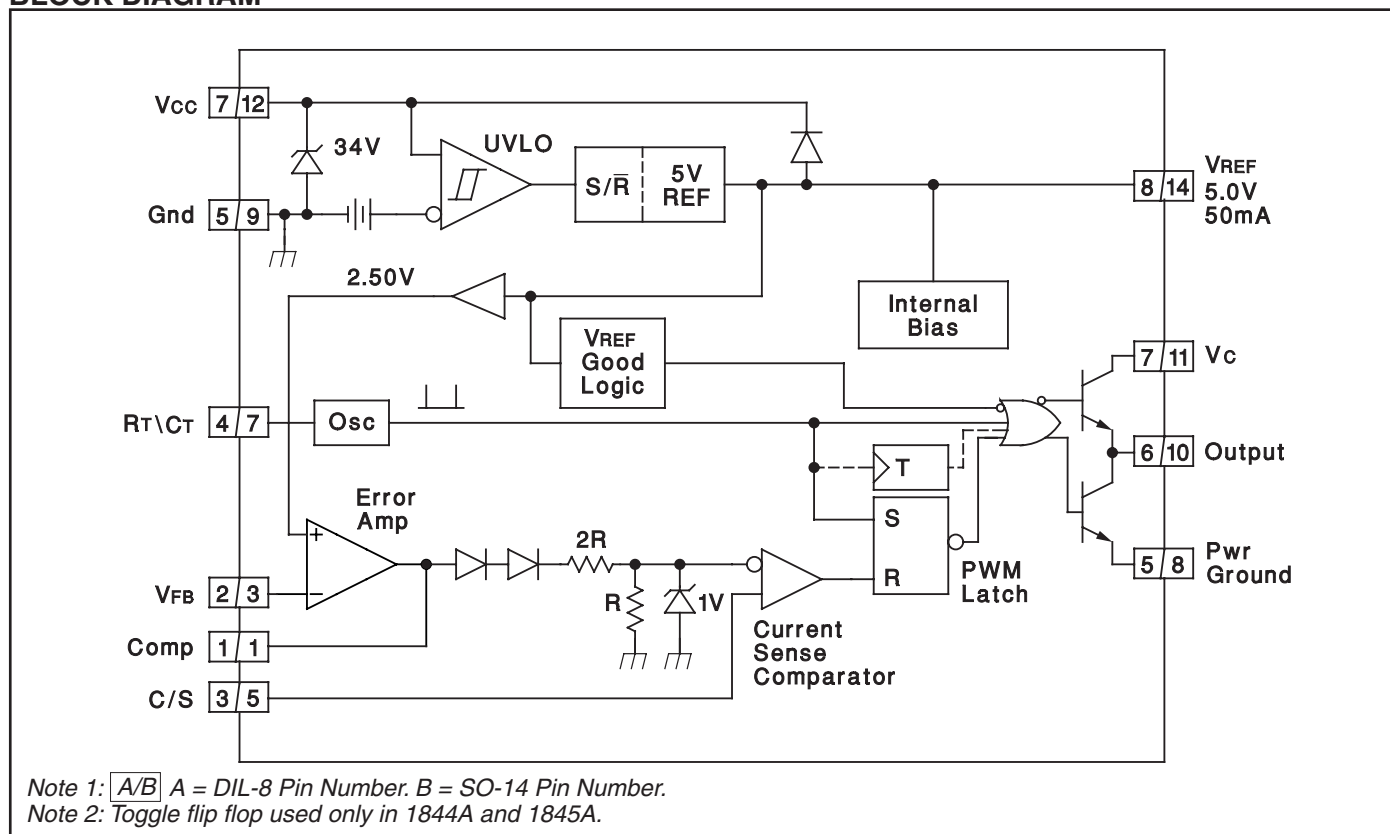

### DESCRIPTION

The UC1842A/3A/4A/5A family of control ICs is a pin for pin compatible improved version of the UC3842/3/4/5 family. Providing the necessary features to control current mode switched mode power supplies, this family has the following improved features. Start up current is guaranteed to be less than 0.5mA. Oscillator discharge is trimmed to 8.3mA. During under voltage lockout, the output stage can sink at least 10mA at less than 1.2V for VCC over 5V.

The difference between members of this family are shown in the table below.

Part #	UVLO On	UVLO Off	Maximum Duty Cycle
UC1842A	16.0V	10.0V	<100%
UC1843A	8.5V	7.9V	<100%
UC1844A	16.0V	10.0V	<50%
UC1845A	8.5V	7.9V	<50%

**Note 2:** Ensured by design, but not 100% production tested.

**Note 3:** Parameter measured at trip point of latch with  $V_{PIN2} = 0$ .

**Note 4:** Gain defined as:  $A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}}$ ;  $0 \leq V_{PIN3} \leq 0.8\text{V}$ .

**Note 5:** Adjust Vcc above the start threshold before setting at 15V.

**Note 6:** Output frequency equals oscillator frequency for the UC1842A and UC1843A. Output frequency is one half oscillator frequency for the UC1844A and UC1845A.

**Note 7:** "Temperature stability, sometimes referred to as average temperature coefficient, is described by the equation:

$$\text{Temp Stability} = \frac{V_{REF}(\text{max}) - V_{REF}(\text{min})}{T_J(\text{max}) - T_J(\text{min})}. V_{REF}(\text{max}) \text{ and } V_{REF}(\text{min}) \text{ are the maximum \& minimum reference volt-}$$

age measured over the appropriate temperature range. Note that the extremes in voltage do not necessarily occur at the extremes in temperature."

**Note 8:** This parameter is measured with  $R_T = 10\text{k}\Omega$  to  $V_{REF}$ . This contributes approximately  $300\mu\text{A}$  of current to the measurement. The total current flowing into the  $R_T/C$  pin will be approximately  $300\mu\text{A}$  higher than the measured value.
